LIVEWIRE!

Inside: the new ATARI computers!

MOSAIC™

64K RAM

SELECT™

*The only
Compatible
64K RAM
for*

**ATARI®
400
And 800**

Now Atari® owners can go where no Atari owner has ever gone before. With the Mosaic 64K RAM Select* you enter the world of more powerful computing with almost limitless applications!

Atari 400 owners have 64K RAM at their disposal, with 48K RAM hard-wired and four banks of 4K RAM. Atari 800 owners can expand up to 192K RAM! All with complete compatibility with Atari peripherals and software.

The owner of a 64K Select will make better use of more powerful peripherals and software. Machine language programs such as Visicalc or word processing have more workspace, up to 30%.

Programming techniques difficult, time consuming or even impossible are now practical. Such as loading DOS utilities once, page flipping, chained programs, player missile data, and/or wedges, etc. etc. etc...

You'll have access to a membership in the Select Members Club to keep you updated of all the new applications! Of course, the Mosaic 64K Select is easy to install and use. No soldering and complete picture guided instructions included.**

The Mosaic 64K RAM Select, the most advanced memory system available for the Atari 400/800 computers. Serious Atari owners won't settle for less.

64K RAM SELECT FEATURES

1. Unlimited software applications.
10. No solder installation.
11. Powerful, most memory available.
100. No chip sockets for better reliability.
101. Versatile — multiple memory configurations.
110. Compatible with 8K and 16K ROM cartridges.
111. Low power design. Less power and heat than Atari 16K RAM.
1000. Can emulate Atari 1200 Memory, 1200 software.
1001. Test cycled 24 hours to insure reliability.
1010. Larger work space for disc software (i.e., Visicalc, Word Processor, etc.)
1011. Four year warranty.
1100. Allows 400 owners to run disc drives more effectively.
1101. Very low cost per byte.
1110. Allows more powerful graphic manipulations.
1111. Complete users guide.
10000. Membership in the "Select" club.
10001. Powerful program library.
10010. Disc emulation software available for super fast loads and saves.
10011. Tool kit software available — never type DOS again (format, directory and much more).
10100. All Mosaic 64K software maintains 48K RAM for program space.
10101. Allows for up to 192K RAM in Atari 800.
10110. Can be used with Atari 16K's and Mosaic 32K's.
10111. Gold edge connectors.
11000. String arrays.
11001. Allows 3-dimensional data arrays.

**WE STICK OUR G
THE SUN D**

GRAPHICS WHERE ON'T SHINE.

You'll never see Infocom's graphics on any computer screen. Because there's never been a computer built by man that could handle the images we produce. And, there never will be.

We draw our graphics from the limitless imagery of your imagination—a technology so powerful, it makes any picture that's ever come out of a screen look like graffiti by comparison.

And nobody knows how to unleash your imagination like Infocom.

Through our prose, your imagination makes you part of our stories, in control of what you do and where you go—yet unable to predict or control the course of events.

You're confronted with situations and logical puzzles the like of which you won't find elsewhere. And you're immersed in rich environments alive with personalities as real as any you'll meet in the flesh—yet all the more vivid because they're perceived directly by your mind's eye, not through your external senses. The method to this magic? We've found the way to plug our prose right into your psyche, and catapult you into a whole new dimension.

Take some tough critics' words about our words. *SOFTALK*, for example, called *ZORK® III*'s prose

"far more graphic than any depiction yet achieved by an adventure with graphics." And the *NEW YORK TIMES* saw fit to print that our *DEADLINE™* is "an amazing feat of programming." Even a

journal as video-oriented as *ELECTRONIC GAMES* found Infocom prose to be such an eye-opener they named one of our games their Best Adventure of 1983.

Better still, bring an Infocom game home with you. Discover firsthand why thousands upon thousands of discriminating game players keep turning everything we write into instantaneous bestsellers.

Step up to Infocom. All words. No graffiti. The secret reaches of your mind are beckoning. A whole new dimension is in there waiting for you.

INFOCOM™

The next dimension.

Infocom, Inc., 55 Wheeler St., Cambridge, MA 02138

For your: Apple II, Atari, Commodore 64, CP/M 8; DEC Rainbow, DEC RT-11, IBM, NEC APC, NEC PC-8000, Osborne 1, TI Professional, TRS-80 Model I, TRS-80 Model III.

Word processing.

It's simple.

The typewriter was a wonder in its time. **Letter Perfect**™ is a wonder for today. Letter Perfect from LJK lets you use your computer to write letters and create reports and edit your work. Change a word. Move a line. Combine two paragraphs. You can do it all

with Letter Perfect, and more. Much more.

When it comes to practical software for Ataris and Apples, Letter Perfect is simple to learn. And hard to beat. Ask your dealer for a demonstration, or write LJK for more information.

ABOUT THE COVER . . .

The cover to this issue illustrates our arcade game Livewire. The cover was prepared by first taking several black and white photos of a monitor and an ATARI 800. The photos were stripped together to form a high-contrast composite, then the composite was shot as a large film positive. The positive was mounted on a sheet of glass, and the screen objects and "laser beams" were cut in. Color was added by taping various sheets of acetate to the back of the film positive. A sheet of diffusion material was then attached to the positive. The resulting artwork was illuminated by two movie lights. As with many of our covers, the light effects were a product of multiple exposures — including separate exposures for each element on the cover. In this case, there were 27 different elements, providing the colorful cover to issue no. 12 of A.N.A.L.O.G.

EDITORIAL

by Lee Pappas

I would like to take this opportunity to answer some of the most frequently-asked questions that have recently been submitted to our offices.

Q: What is the meaning of your name A.N.A.L.O.G.?

A: When Michael and I came up with the idea of starting the first ATARI-only publication, one of the most difficult aspects of the magazine was coming up with a suitable name. Since DIGITAL Equipment Corporation is predominant in our area (their headquarters is a half hour from our office), I jokingly suggested we call the magazine ANALOG (Amazingly, we have had people ask us if we know that an ATARI is a digital computer.) Michael then came up with **A.N.A.L.O.G.**; ATARI Newsletter And Lots Of Games.

Q: How do you print your program listings?

A: Our program listing method didn't just come about. A year ago, Charles Bachand wrote a custom program called, appropriately enough, LISTER, which has options to work with either C.Itoh or Epson printers. The program will print out all ATARI special graphics characters and inverse video. Our listings are printed 38 characters wide, the same format that they will appear in on your TV set if they are typed in correctly. This makes visual debugging of your typed programs easier. Our program listings are also printed out directly from working copies of the program. This helps to eliminate errors. While other listing methods are available, time has proven this as the most effective.

Q: Who writes the articles and programs in A.N.A.L.O.G.?

A: Roughly half of the editorial content in the magazine is produced by readers like yourself. I feel our publication, for its size, has the most talented staff of any computer magazine in the country. We are very lucky to have the services of Charles Bachand, Tom Hudson, Tony Messina and Brian Moriarty, who are among the most knowledgeable ATARI programmers in the field today, bar none. Our programs such as **Fill'er Up**, **Adventure In The Fifth Dimension**, **Maniac**, and **Livewire** are equal to, and in some cases better than, many commercially available pieces of software. Our utility programs ARE useful, our tutorials DO educate.

Q: What back issues are available?

A: Though several previous issues have been reprinted, at present only issues #2, & #7, and a limited supply of #9 & #10 are available. The **A.N.A.L.O.G. COMPENDIUM** will be ready shortly. This 160-page book will include the best programs and materials from the first ten issues, along with fresh material from the **A.N.A.L.O.G.** editorial staff. The **COMPENDIUM** will be spiral bound in 8½" x 11" format, will accept no outside advertising, and should be on sale at your favorite book or computer store August 1st.

Q: When is A.N.A.L.O.G. going monthly?

A: We have been contemplating going monthly since the publication of the first issue. Our first obligation is to our readers. When we feel that we can maintain the present quality of the magazine as a monthly publication, then we shall go monthly. With a bi-monthly circulation approaching 100,000, few of our readers have seen our total growth potential.

This issue of **A.N.A.L.O.G.** marks the end of our second year of publication. Michael DesChenes and I, along with the entire staff, would like to thank our readers, contributors, advertisers, and ATARI, for making **A.N.A.L.O.G.** what it is today: the first and best ATARI-only computer publication in the world. □

READER COMMENT

Sir:

At the end of each marking period, teachers in my school are required to complete a grade report showing grade distribution for each section. I guess many other teachers also have this sort of paperwork. The program listed below accepts letter grades A through E, counts the entries, and figures percents. The program also totals these numbers for several sections. The program is written to accomodate classes of up to 50 students. More students can be allowed by changing the dimension of A in line 10. There is no limit on the number of sections that can be accumulated. Although the program was written for the ATARI, it should be relatively easy to translate for other computers.

Sincerely,

Jeff Meyers

Baltimore, Maryland

Dear Sirs:

I would like to make a comment about Mr. Randall Beemer's letter in A.N.A.L.O.G. No. 11. It is pathetic to see some of the people in this world who just cannot appreciate anything or admit their own mistakes. For example, I am a head photographer in my high school. When everything is smooth, no one says a word, but when you make a mistake, you'll hear it until you're sick of it and start to talk back.

I bought my 800 only three months ago, yet I'm proud to claim that I'm on my way to becoming a computer "pro." I understand how programs work, and have begun to write some of my own. Where else could I have learned so much in such a short

time? I know that it's a rhetorical question, but the answer is A.N.A.L.O.G. When I first started, A.N.A.L.O.G. programs didn't work for me either. However, you don't start driving racing cars until you've learned how to drive a car. It's the same with programming. You start with small programs like "Guess My Number" and gradually move up to a 1K program. If it works, then move on to a 2K program and so on.

Notice how A.N.A.L.O.G.'s program listings match up to the screen perfectly. Even special graphic characters are there. So far, A.N.A.L.O.G. is the only magazine for ATARI that has

Micro Match™ SAVES MONEY

program listings which "synchronize" with the screen. This makes it many times easier to visualize just where you are in the program. If you take a straight edge and place it across the program so that only one line can be viewed at a time, your eyes will be less confused. Therefore, your eyes will read more accurately. Finally, I'm happy to say that An Adventure Game, The Halls of The Leprechaun King, and Fill 'Er Up worked flawlessly as listed.

In conclusion, if anyone refused to subscribe to **A.N.A.L.O.G.** and have an ATARI computer, they're on a diet for knowledge. I personally thank the **A.N.A.L.O.G.** staff for sharing so much of their knowledge with me at an unbeatable price. To refuse **A.N.A.L.O.G.** is maddening, not "sitting for four or five hours putting programs into the computer and not having

them work." After all, not everyone can learn how to ride a bicycle without falling at least once.

Sincerely,
Hay Doan
Warren, Ohio

Thank you for your very kind words. I think that most editors would agree with me if I said that putting out a computer magazine must be one of the most difficult publishing jobs in the world. You have to assemble text, technical jargon, complex charts, and different types of program listings into some type of coherent form. (It is standard practice in the publishing world to notice typos and other mistakes only after you've printed 100,000 copies.) What's doubly annoying in producing a computer magazine is the fact that if there is but one error in a program listing, it can render the entire program useless. Occasionally the problem resides in

the way the article is pasted up, or (rarely) a printing error can truncate a few characters from a listing, with the afore-mentioned results. All of the program listings in **A.N.A.L.O.G.** are listed directly from working copies of the program, using Charles Bachand's screen dumper. (See this issue's editorial.) This helps us keep program listing errors to a minimum.

—J.B.

Dear Sirs:

Here are some reprints of a couple of articles I wrote back in December of 1982 for our local ATARI Users' Group Newsletter, **(FR)ANTIC**. Incidentally, we sent several copies to individuals at ATARI, Inc., like Mark Cator, and Clarice Weisbach, just as we do every month.

I thought you might find it interesting that many of the same points your Mr. Brian Moriarty made in **A.N.A.L.O.G. Computing**, Issue #11, were also noted in my articles. Feel free to reprint these articles, in whole or in part, in your next issue.

I have also learned that ATARI now offers backup copies for sale to end users (presumably with proof of purchase) for \$30.00 extra! I consider this to be a very weak attempt at supporting the user. Programs like **BRODERBUND's BANK STREET WRITER** come with two copies on two separate diskettes, and they were provided at a total cost to the user, less, indeed much less, than the other similar performance products!

In closing, I would like to applaud your publication for having at least covered the topic of **BACK-UP VS. PIRACY**. I also noticed that your article never even mentioned **HAPPY COMPUTING**...I wonder why?

Sincerely,
P.R. Serafine, O.D.
President,
Alamo Area ATARI
User's Association

Attention Programmers!

A.N.A.L.O.G. Computing is interested in programs, articles, and software review submissions dealing with the ATARI 400 and 800 home computers. If you feel that you can write as well as you can program, then submit those articles and reviews that have been floating around in your head, awaiting publication. This is your opportunity to share your knowledge with the growing family of ATARI computer owners. **A.N.A.L.O.G.** pays between \$30.00-\$360.00 for all articles. All submissions for publication must be typed, upper and lower case with double spacing. Program listings should be provided in printed form, and on cassette or disk. By submitting articles to **A.N.A.L.O.G. Computing**, authors acknowledge that such materials, upon acceptance for publication, become the exclusive property of **A.N.A.L.O.G.** If not accepted for publication, the articles and/or programs will remain the property of the author. If submissions are to be returned, please supply a self-addressed, stamped envelope. All submissions of any kind must be accompanied by the author's full address and telephone number. Send programs to: Editor, **A.N.A.L.O.G. Computing**, P.O. Box 23, Worcester, MA 01603.

TAKE COMMAND OF PLAYER-MISSILE GRAPHICS

PM animator

by Roger Bush

You can write brilliant animated graphics in Atari BASIC—without any bit-mapping, and without knowing machine language.

All you need is **PM ANIMATOR**, the new Player-Missile Graphics toolkit from **DON'T ASK**.

PM ANIMATOR makes it easy to: draw pictures and animate them, change your drawings and animation sequences, save your graphics creations on disk, and build them into your BASIC programs. You do it all with Player-Missile Graphics. You do it from BASIC, using two almost magical editors, plus **PM ANIMATOR's** special subroutines for Player-Missile Graphics control.

Create the most visually exciting software you've ever written. The power is yours.

Have your software dealer demonstrate **PM ANIMATOR**. Includes numerous demos and detailed owner's guide/tutorial. Requires 32K, disk. Suggested retail: **\$34.95**.

Also available by mail from **DON'T ASK**. Send check or money order for \$34.95 + \$2.00 shipping/handling; California residents add 6% sales tax (6.5% if you reside in L.A. County).

Atari is a trademark of Atari, Inc.

DON'T ASK COMPUTER SOFTWARE

2265 Westwood Blvd., Ste. B-150
Los Angeles, California 90064
(213) 477-4514

PHONE RIGHT IN WITH Teletari

The Friendly Terminal
by Harry Koons

Want to put your Atari in touch with other computers? **TELETARI** is just what your modem needs: a powerful telecommunications program that's a breeze to use. Choose the functions you want from a menu. Send or receive text or programs, save new data on disk, or print it on paper. A buffer of up to 20K bytes holds your data; page through it to find what you want. Adjust and save terminal parameters with another menu.

TELETARI is adaptable to most remote computers and most modems, including 1200 baud modems. It works through the RS232 port on the Atari 850 Interface, and it's suitable for any RS232 application and supports all 850 options. It's also compatible with the Bit 3 Full-view 80™ board.

Ask your software dealer for **TELETARI**, by **DON'T ASK**. **\$39.95**. Requires 32K, disk, BASIC, 850 Interface.

DON'T ASK COMPUTER SOFTWARE

2265 Westwood Bl., Ste. B-150
Los Angeles, CA 90064
(213) 477-4514

Or order by mail direct from **DON'T ASK**. Add \$2.00 shipping/handling to your check or money order. Calif. residents add 6% sales tax (6.5% if you reside in L.A. County).

Dealer inquiries welcome

Atari is a trademark of Atari, Inc. Full-view 80 is a trademark of Bit 3 Computer Corporation.

The articles Mr. Serafine enclosed with his letter make fascinating reading. A substantial excerpt from one of them is reprinted below.

Look for my profile of the notorious "Happy Drive" elsewhere in this issue.

—B.M.

I have it from a spokesperson at ATARI CORPORATE that it is quite legal to "back up" or duplicate ANY existing program from ATARI or anyone else, PROVIDED that it is for your personal use. So if this is true, then why do software producers copyguard their products? The answer is obvious...to prevent UNAUTHORIZED duplication. The only trouble is, that it also prevents the purchaser's "authorized" duplication for personal use.

I feel that the software companies in general have missed the mark in trying to prevent Piracy. The policies of obtaining a back-up copy of software from a producer leave quite a lot to be desired. I am not opposed to copyguarding. My favorite game is PREPPIE!, which is one of the most heavily copyguarded programs available anywhere. What I am opposed to is the attitude of the companies that produce software that the purchaser only be given a new copy of the software, if the original is ruined, or defective, and usually only when the original is returned (presumably as proof of purchase) and only when the purchaser PAYS a fee ranging from \$3.00 to nearly the full price of the software! This is ridiculous!

An example of a very reasonable policy is that of Adventure International. You can obtain a back-up copy of the game PREPPIE! by sending in a proof-of-purchase coupon and the cost of the diskette. You get two fresh copies of the program for the purchase price plus this media price. You don't lose your original in the bargain.

An example of a ridiculous policy is ATARI, Inc. You can purchase for \$150.00, The Bookkeeper, which comes on four SLOW FORMAT and heavily protected diskettes. What's more, these diskettes do not even have reinforced hub rings! All this on a program which must, by its very nature, constantly access the diskettes. Surely it doesn't take a genius to figure out that the diskettes WILL eventually wear out. Well let's see, we can back up our Bookkeeper, right? Well, unless the user has a special version of ATARI DOS, he/she cannot, since the disks have "bad sectors" which cause DOS to hang up. Well, maybe we can send in a coupon...oh, they don't give one with it. Well maybe they state their replacement policy on the package or in the documentation...oh, they don't.

This sort of attitude is what promotes Piracy. The companies which do not provide a fair means of obtaining a back-up copy of their software are in the majority. They spend thousands of dollars on programming and equipment to copyguard their products, and of course they pass this along to the purchaser. This higher priced software is justifiable if the company will provide a back-up copy for a reasonable price with proof of purchase. It is not justifiable if the company provides the software on inferior media and has NO stated back-up policy other than for the user to purchase a second copy at full price! Synapse Software is now providing a back-up copy of FILEMANAGER 800+ on the flip side of the original. This is a middle ground policy, but what happens if the disk is physically damaged? You zap BOTH copies at once! This is not as ideal a policy as that of Adventure International.

What is the solution for the end user? By boycotting the companies whose policies are unreasonable, your power can be felt! By writing to these com-

panies and complaining your voice can be heard. It is also a good idea to write letters of praise to the companies whose policies you feel are fair, for positive reinforcement. I believe in getting quality software on quality media when I pay a premium price for it, and I think it is my right as a purchaser to have a back up copy for insurance against needless down time when my original is lost or damaged. If we were getting our programs on an indestructible medium, I could understand the company's not providing a back-up, but diskettes and cassettes are perishable! □

Dear Editor:

Thank you for including ABC in your review of BASIC compilers for ATARI computers. We at Monarch Data Systems feel the review was honest and fair in showing both positive and negative aspects of all the products.

There was, however, one mistake in the review regarding the line number that caused ABC to generate an error. The review reported that the error occurred on line 66 of the adventure program. It was really line 68 that caused the problem. Line 66 has only three GOSUBs but line 68 has 25! Due to an incorrect constant in the compiler, the current version of ABC only supports at most 20 GOSUBs in a statement. This minor problem will of course be fixed in future releases.

We would also like to clarify two points that have caused some confusion to our customers.

1. ABC does allow variable expressions in DIM, GOSUB, GOTO, and RESTORE statements.
2. ABC automatically shows both the error code and BASIC line number when errors occur at run-time.

Thanks for letting us clarify these points and keep up the great work on the magazine.

Sincerely,
E. Goldberg

Director of Marketing
Monarch Data Systems

Sorry about the typo. Incidentally, if you want to compile Adventure in the 5th Dimension with Monarch's ABC (version 1.02 or earlier), simply replace the following lines:

```
66 GOSUB 16:GOSUB 28:M$(Q,Q+C15)=CL$:ST$(C5,C5)=CHR$(Z):GOSUB 28:CL$=M$(Q,Q+C15):? OK$:POSITION C2,C0
67 ? #C2;"Your location:";:POSITION C2,C1:Z=Z-64:IF Z>19 THEN ON Z-19 GOSUB 45,46,46,46,47,48:GOTO 69
68 ON Z GOSUB 30,31,31,32,31,31,31,33,34,35,36,37,38,39,40,41,42,43,44
```

—B.M.

Dear A.N.A.L.O.G.:

I have a question concerning your recent article on disk copy programs. My friend, who owns an Apple II, tells me about games he has copied from his friend using *Nibbles Away 2*. It would be a waste of time to go on about my honest intentions in using such a program, but I can just say that they would be honest. Anyway, it said in the article that "if you want to make dupes of *Choplifter*," etc., etc., "forget it!" Well, honestly or not, this is what my friend is doing, and I am wondering if there is anything like this for the ATARI. Your article said that there was not, but why? It also talked much about the mechanical workings of the 810. Do the Apple and the ATARI drives differ so much that the Apple is able to produce a copy of an Apple game, but the ATARI is not able to make a copy of an ATARI game?

I hope you can clarify this for me.

Sincerely,
Chris Bull
Carlisle, MA

Apple disk drives are "dumb." This is not intended as a slur; rather, it indicates the Apple drive's lack of built-in controller circuitry. The Apple's disk access functions are

*directed by an external controller board that plugs into the computer. This arrangement makes it possible to read or write an Apple disk almost any way you want — unlike the semi-intelligent ATARI drive, which allows only one type of read and two types of writes. The result is that it is much harder to copy-protect an Apple disk than it is to protect an ATARI disk. This fact has not been lost on programmers like Dan Gorlin (the author of *Choplifter*), who deserves a fair profit from the sales of his game and would probably be very interested to know why your "friend" is making unauthorized backups.*

NEW PRODUCTS

by The Program Doctors

There are many new, exciting developments from the world of ATARI. ATARI is now seeking outside help from such companies as Datasoft and Roklan in software development. They have bought the rights to such quality programs as Reston's *PAINT* and Visicorp's *VISICALC* to be re-released under the ATARI brand name. In the very near future you will see *DONKEY KONG*, *MS. PAC-MAN*, *SUPERMAN III*, and a new cartridge version of *EASTERN FRONT*. The most important news from ATARI is the fact that several new computers with associated peripherals will be unveiled at the Summer Consumer Electronics Show. (See *A.N.A.L.O.G.*'s profile of these products elsewhere in this issue.)

On the third-party software front there have been several great new pieces of software released, especially in the arcade classification. Broderbund has done an excellent job putting both *CHOP-LIFTER* and *SERPENTINE* on ROM. *A.E.*, a 48K disk with 3-dimensional graphics is the best of their new games. Beginning on Earth, you must chase the swooping *A.E.*, which fly in varied formations off the Earth's surface to the outer reaches of the Milky Way. Unlike other 3-D games, *A.E.* actually uses its graphics to enhance playability. Game play is fast and the five screens accurately recreate actual solar system conceptions.

The long-awaited *Sky Blazer* is finally out. If this game had been released on schedule (almost a year ago) it might have been something special. But with the constantly improving quality of game software, this game does not break any new ground.

A.E.

To say that Broderbund's *BANK STREET WRITER* is an excellent word processor would be a very misleading statement, unless we qualify it by saying *HOME* word processor. While *LETTER PERFECT* is still the reigning Cadillac of word processors for the ATARI, it is expensive, requires a certain amount of "study time" to be able to use all the features effectively, and contains some things that are best suited for a small business. While *BANK STREET WRITER* has many limitations (no underlining, no right justify, no boldfacing, no mail list merge), its simplicity is its best feature. Most of the standard editing features are included, and on the back side of the disk is a tutorial that will take you step by step through the major menu options, with more in-depth instruction supplied in the well-written reference manual. Broderbund set out to write a word processor geared to students' term papers or that overdue letter to your Uncle Ron in Philadelphia, and in this they have succeeded admirably.

When the first Sirius games were released they were criticized for their under-utilization of ATARI's sounds and graphics. *SNEAKERS*, *SPACE EGGS* and *SNAKE BYTE* were Apple clones. With *BANDITS* and *WAYOUT* they turned the corner, since both were great games. Now with *REPTON* and the Hi-Res adventure *BLADE OF BLACK-POOLE* they can be considered among the elite of the third party creators. It takes a lot of guts to place the words "KILLER GAME" under the title *REPTON* but they are not kidding. This "save your planet from absolute destruction" game is unlike any of the previous "SYMFAD" games because in order for you to win you must have your planet destroyed. Sirius may have confused some people with their disk-based instructions but there are TWO separate screen displays, the second of which you can't get to unless you lose during the first part of the game, but survive! If this sounds confusing check this game out; it contains some of the most complete uses of ATARI sound and graphics to date and is a must for any *DEFENDER* freak.

Experienced adventurers will enjoy *BLADE OF BLACKPOOLE*, with its fast graphic drawings and point system style of play to allow replayability. Its medieval theme and fantasy logic take you on a picturesque journey in search of a mighty sword,

supposedly hidden in the Lake of Blackpoole. Sirius has yet another winner with this adventure and their soon-to-be-released *CRITICAL MASS* will surely place them right up there with Scott Adams, Infocom and Sierra On-Line as adventure leaders. But we feel that a word to the marketing people at Sirius is now called for. ATARI computer owners are a sophisticated lot. The amount of quality software you are producing is great and you should be congratulated. But *please* stop releasing your VCS conversions! *WORM WAR II*, *FAST EDDIE*, *TURMOIL*, and *SQUISH 'EM* are poor excuses for computer arcade games. Although all of these ROM-based games are conceptually good they lack the fine programming techniques with which Sirius is becoming synonymous. If the same attention that was paid to *SQUISH 'EM* for the Commodore 64 was given to the ATARI version, then this game could have been a hit, but we cannot recommend it.

Squish 'em

Sierra On-Line seems to be going in the opposite direction of Sirius. The company that gave us *FROGGER*, *THRESHOLD*, the original *JAWBREAKER* and the Hi-Res adventures, while still holding their high standing in the Apple market, is rapidly losing the respect they have earned from ATARI owners by releasing such programs as *MAURADER*, *WALL WAR*, *LUNAR LEEPER* and the re-written *JAWBREAKER*.

MAURADER is a cheap combination of *MISSILE COMMAND* and *SHAMUS*, with poor graphics, sounds and playability. *LUNAR LEEPER*, while a somewhat better game, is also sadly lacking in the graphics and sound areas. *WALL WAR* is a graphic symphony, and upon first boot-up, we began to think that maybe On-Line had come to their senses. Then we played it, and realized that the game is totally pointless. On-Line's decision to release their new version of *JAWBREAKER* is really hard to fathom. The third and latest version is an imitation of the Tigervision version written for the VCS. Unless this is a result of the widely publicized lawsuit

between On-Line and ATARI over *PAC-MAN*, we can see absolutely no reason to take what was at one time the most popular game for the ATARI computer, and turning it into a class-B piece of software.

Fort Apocalypse

The recent release of five new games (*FORT APOCALYPSE*, *SHAMUS:CASE II*, *SURVIVOR*, *NECROMANCER* and *THE PHAROAH'S CURSE*) places Synapse at the top of the heap in third party software for the ATARI. *SHAMUS: CASE II* is a sequel to the original software smash. The Shadow is back with a new underwater fortress and new sidekicks to deter you as you attempt to find his throne room and rid the waters of his dastardly deeds. The lack of a pause key in the original was a major problem since, unless you had 3 arms and 4 eyes, there was no easy way to map the floors of the Shadow's Lair. In *CASE II* you not only have a pause key but whenever you do take a break you can view the entire progress of your mission. (The program draws the map for you and it saves that map from game to game.) Gamers please note: *CASE II* is totally different from *CASE I*, and this 32K T/D game is great.

Shamus II

The strangest of the new Synapse titles is *NECROMANCER*; this game is impossible to describe in the space allowed. It consists of three totally different sections, all interrelated; the second and third contain five levels each. Game play is fast and furious, and there is nothing that can be compared to *NECROMANCER* on the market at this time.

Necromancer

There have not been many games that four people could play at the same time, but *SURVIVOR* allows up to four interactive players working together to eliminate the armed forts of the Xenogryphs. Some very nice spaceship movement and shooting effects are included. *THE PHAROAH'S CURSE*, a multi-level arcade-adventure in the style of *SHAMUS*, and *FORT APOCALYPSE*, a combination of *CHOPLIFTER* and *CAVERNS OF MARS* round out the list of Synapse's latest products.

Odesta has released three new programs. *CHESS*, *CHECKERS*, and *ODIN* are just about as good as you can get. Beginning with the first-rate packaging job and going all the way to the well-written documentation, these programs are top-shelf. The programs were written by people who are authorities in their fields. Peter Frey is one of the U.S. Othello Association's top-rated players and a professor at Northwestern University, teaching psychology and computer science. Larry Atkin and David Slate are winners of the World Computer Chess Tournament, and 8 North American Computer Championships. These credentials alone should convince you that the game logic is superb, and all of the extra features just add to the overall polish. There are too many of them to list them all, but they range from different levels, opening move libraries, advice and prediction of best moves, graphic illustrations of attacks and defenses, and our favorite, the *MOVIE*, in which you can play a game, and then have the computer play it back for you. These games are highly recommended for people in all skill categories; they will help the beginners and challenge the masters. We don't know what will

come next in the *MIND OF MAN* series, but if Odesta is open to suggestions, we sure could use some quality software for bridge, hearts, gin rummy, Scrabble...

SPY'S DEMISE is the winner of this issue's "Potato Chip" award. You can't stop playing it. Penguin Software's first ATARI release is an original arcade-type game that combines good graphics, catchy tunes and a puzzle in what is basically a very simple concept. The first line of the documentation describes it like this: "Generally there are two instructions. Left. Right." The idea is that you are a spy trying to locate and decipher the parts of a secret code that have been stored on separate floors of a diplomatic mission. The playfield is a grid work of the floors of the building, and you must make your way across each floor, and up to the next one, until you reach the top. There are seven embassy guards riding up and down in elevators and you must avoid them as you make your way across the floors. If you can make it to the top of the screen, you are rewarded with one line of a cryptic message. Each successive screen has one less floor, making it harder and harder to accurately time your walk across. Gather all the information, crack the code and Penguin Software will award you with an official *SPY'S DEMISE* T-Shirt (according to Penguin, T-Shirts will be awarded to the first solver from each state, each Canadian province, and each other country, but we feel that anybody who can solve this is deserving of recognition!) We welcome Penguin Software to the ever-growing list of third party producers and ask if *SPY'S DEMISE* is here now, can *PIE-MAN* and *TRANSYLVANIA* be far behind?

Spy's Demise

The long awaited *STARBOWL FOOTBALL* is finally available. Gamestar redid the game when it realized that 16K would not be enough memory to make a realistic football game. Styled after Mattel's Intellivision classic, at 24K *STARBOWL FOOTBALL* is by far the best sports game for the ATARI at this time. Its one or two player option is a definite

SURVIVAL Computer Game

For
ATARI®
16K

Your only chance for survival is to trudge 340 kilometers to an abandoned research station when your starship is downed on an alien world. But your food supply and weapons are limited to what you can carry, and the planet's carnivores are huge and hungry. SURVIVAL features full-color terrain and computer-generated encounters. Great for solitaire or multi-player gaming!

Experience the thrill and excitement of ship-to-ship combat in deep space. In this game for two players, each player creates a fleet, and then enters his moves and the weapons he wishes to fire. The computer resolves all movement and combat, records the damage, and then scores the victory points. Design your own scenarios, or use the preset ones—either way, STARFIRE is a classic!

STARFIRE COMPUTER GAME

For
ATARI®
16K

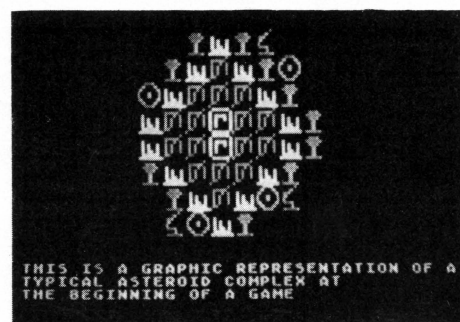

ASTEROID **ZERO-FOUR**

THE WAR OF **THE WORLDS**

Relive H. G. Wells' classic tale of the battle that ensued when the Martians invaded Earth and the humans desperately struggled to save Mankind. The computer-controlled Martians land their pods and launch their attack by burning anything and everything in their path. The player controls the humans, and must figure out how to stop the Martians before all of London is burning.

Your space fighter bomber swoops over the surface of the asteroid through the red glare of the laser towers' deadly fire. You are trying to incapacitate the asteroid's mining operations. But is your own asteroid safe? In this game for one or two players, you attack your opponent's asteroid with your heavily-armed bombers, and must score repeated hits to destroy it.

TASK FORCE COMPUTER GAMES™ are strategy games rather than reaction games. They allow a player time to think out his best move. The game program is recorded on a cassette tape, and complete instructions are included for loading and play.

All **TASK FORCE COMPUTER GAMES™** require an Atari® 400 or 800 16K computer and an Atari® 410 Cassette Player. Some require joysticks. A program version which allows the game to be replayed without reloading from the cassette tape is included for players with a 32K machine.

New Strategy Games for Atari 16K Cassette from
TASK FORCE COMPUTER GAMES™
The **NEW FORCE** in gaming.

plus (it's hard enough getting our mates into space games without forcing a football game down their throat).

The most difficult aspect of *STARBOWL* is the offensive pass catching. Here's a hint: watch the defensive man who is guarding your designated receiver; as soon as the defensive man cuts to cover his programmed area throw the ball. This will increase your completion percentage. Speaking of sports games, another delayed release is Inhome Software's *BASEBALL*. This TWO player cartridge lacks playability, and at \$50 retail your money could be better spent on a number of different items.

Datasoft's official Sega version of *ZAXXON* is here. Sadly, the 16K tape does not recreate the glamour of playing the arcade classic. On disk the program is definitely improved but unfortunately it still doesn't make you feel as if you've inserted a quarter in the slot. Don't worry, some enterprising programmer will take the *ZAXXON* concept and design a better game. Datasoft has not only antagonized the buyer by their widely advertised "available now" (in actuality the disk version was not out until May), but they did not even recreate the arcade feel of the game.

Zaxxon

The latest release from EPYX, a company well-known for its BASIC adventures, is called *JUMPMAN*. When we first heard of the pending release of this game we were, quite frankly, very skeptical. Upon seeing the game we were astounded. *JUMPMAN* is by far the best piece of software from EPYX. A 30-screen machine language arcade game with many difficult options, *JUMPMAN* includes music, great arcade sounds and graphics, and many different scenarios. Your mission is to rid Jupiter headquarters of bombs planted in every room. The building is heavily protected by robots, dragons, birds and unseen sharpshooters. Your *JUMPMAN* must climb ladders and ropes, deal with vanishing mazes and solve puzzles as he attempts to save the building.

Speaking of climbing games, another excellent one is *CRISIS MOUNTAIN* from Synergistic Software. This strategic action game combines two separate cavern scenes with increasingly difficult levels of play. You must disarm a cave that has been booby-trapped by terrorists and pick up their supplies and loot before the bombs explode and destroy the West Coast. *CRISIS MOUNTAIN* is quite addicting and random placement of the bombs and bonus objects make this dual screen game different every time you play.

Spinnaker has added to their rapidly growing line of educational products with *KINDERCOMP* (Ages 3-8), *STORY MACHINE* (Ages 5-9) and *FACE-MAKER* (Ages 4-12). These 48K disks integrate learning with computer familiarity in a way that is fun and exciting. *KINDERCOMP* is five games in one: completing number sequences, matching series of shapes, drawing colorful pictures on the screen and having the computer act out a kaleidoscope of your child's name all help to develop creativity and improve counting skills and reading readiness. *STORY MACHINE* helps children learn to write sentences using words from a supplied listing, and then the computer acts it out. *FACEMAKER*, a computerized form of Mr. Potato Head with animation, is Brett's favorite (our two-year-old son — Theo's the computer, Brett's the kid!).

Financial Software Plus, Kalamazoo, MI., and Habcom Business Systems, Inc., Lindenhurst, IL., are helping to fill the void in the "Where is all the business software for the ATARI?" department. Financial Software Plus has a new *PAYROLL PACKAGE* that's user friendly and will work as a stand-alone program or as an integral part of their general ledger program. It was written by an accountant-programmer and is very flexible. The tax codes are user-changeable, with the ability to put in five different tax tables. It will run on a one- or two-drive system, and all reports including checks can be printed to either the screen or an optional printer. With a capacity of 100 employees per disk (and an unlimited number of disks), it can be used by almost any size company effectively.

Professional systems from professionals is also what Habcom Business Systems is all about. They are marketing a complete hardware and software package for funeral homes, and software written by a licensed funeral director. This program will handle all billing information efficiently and enables you to print itemized statements, payment reminders, collection letters and aging reports, with Pre-arrangement File and Inventory Control as optional features.

Computari has published the first issue of *Financial Wizard Newsbits*, sent to all Financial Wizard owners. It will be sent periodically to keep you informed of updates to FW, the first of which

should be available soon. *UTILITIES* #2 will contain three additional ways to make your FW an even more powerful and useful tool. *LEDGER* will provide a general ledger printout by month; *REGISTER* will give you a complete check register with a balance shown next to every entry; *FORECAST* will give you statistical analyses and graphical representations of your future expenditures.

A-Bit-Better-Software (ABBS) has found a bug in the sort routine of their *MAGIC MAIL* program. If you own this program and are having trouble sorting, send your disk to ABBS at P.O. Box 28, Laurel, MD 20707, and they will send you a fixed version.

That about wraps it up for this issue. If by some bizarre chance you have not found at least one new program that appeals to you, come back next issue when we will report on the Summer Consumer Electronics Show and the First Annual Software Showcase. □

For your ATARI 400/800/1200

THE EXAMINER

- Give your cartridges a good look.
- Read any portion or all of your cartridge into memory.
- Save to cassette or disk thru DOS.
- Uses joystick ports 1&2 or 3&4.
- Disassembler included – all machine language – list to screen and printer – HEX, ASC, Assembly Code displayed.

\$89.95 Introductory Priced for ninety days

THE BYTEWRITER PROM BURNER

- Uses joystick ports 1&2 or 3&4
- Programs, Reads, Verifies 2516, 2716, 2532, 2732, 2732A, 2564, 2764, 68764, 27128
- No personality module

Introductory Price good for ninety days **\$149.95**

90 Day Limited Warranty. Mail Cashiers check or Money Order (Personal checks will add 3 weeks to the 4 to 6 week delivery) plus \$3.00 shipping to:

CONVOLOGIC, INC.

Disked

by Mark Logies

Take a closer look

Runs in 32K ...
ONLY \$89.95

THE DISKED UTILITY PACKAGE contains numerous utility programs plus a comprehensive users' manual. With *DISKED* you can view and edit the contents of any sector in HEX, DECIMAL or CHARACTER (ATASCII or SCREEN CODE). You can disassemble programs into 6502 mnemonics using virtual addressing. You can recover deleted files, save crashed diskettes, map used and crashed sectors, copy any sector or block of sectors, move cassette boots up to disk and vice versa, create immediate mode files and multi-boot disks, PLUS MUCH MORE!

Each program is listable and user adaptable.

- Disassemble code into source compatible files
- Support non-standard cassette format
- Extensive memory reference
- Search routines (up to 128 bytes long)

Electronic Notebook

If you can jot it down on paper you can do it even more efficiently with *ELECTRONIC NOTEBOOK*. Simple to use. Flexible formatting. Comes with a manual and its own redefined graphics characters. Save anything on the screen to disk from drawings (high res) to mailing lists.

24K Diskette \$29.95

magic Storybook

For young and old. See the three little pigs unfold before you in a beautiful scrolling storybook. Enjoy animation and a delightful musical narrative sound track.

16K Cassette \$29.95

Orders must include \$1.50 shipping and handling.

KNIGHTS OF THE DESERT™

Introducing SSI's simulation of the North African Campaign of World War II — for your APPLE®, ATARI® and TRS-80®.

KNIGHTS OF THE DESERT.

A pretty classy name for a classic wargame.

In the year 1096, knights in shining armor set out on the First Crusade, marching across Asia Minor to reach the Holy City of Jerusalem and free it from the invading Turks.

Nearly a millenium later, in 1941, a similar scenario would be played out. This time, Crusader tanks of Great Britain rolled across the broiling sands of North Africa to repel invaders of a different sort — the armored forces of Nazi Germany.

KNIGHTS OF THE DESERT is the faithful recreation of this 20th century crusade. As Field Marshal Rommel, you must push your Panzer and infantry divisions eastward to take Alexandria. As the British commander, you must sweep Rommel back to El Aghelia and win the game.

This simulation has everything you've come to expect in an SSI wargame: historical accuracy and detail; complete morale and strength ratings for all units; innovative movement rules and combat systems; two-player and solitaire modes; and best of all, maximum playability.

To see if you've got what it takes to meet this historical challenge, start off on a little crusade today — a quick trot to your nearest computer/game store to free this game from the dealer. No fighting is necessary. Just \$39.95.

STRATEGIC SIMULATIONS INC.

If there are no convenient stores near you, VISA and Mastercard holders can order direct by calling 800-227-1617, ext. 335 (toll free). In California, call 800-772-3545, ext. 335.

To order by mail, send your check to: Strategic Simulations Inc, 883 Stierlin Road, Bldg. A-200, Mountain View, CA 94043-1983. (California residents, add 6.5% sales tax.)

KNIGHTS OF THE DESERT is available on 48K disk for the Apple® II with Applesoft ROM card; 40K cassette or 40K disk for the Atari® 400/800; and 16K cassette for the TRS-80 Level II, Models I & III. When ordering, please specify computer and format.

24K disk

by Tom Hudson

There are several graphics artwork programs available for ATARI personal computers. One of the more popular packages, Datasoft's MICRO-PAINTER, allows the generation of pictures in GRAPHICS 7+, a mode that is not available with the current operating system.

Many people would like to use pictures generated with MICRO-PAINTER in their BASIC programs, but don't know how to load them. This article will present a fast, machine-language subroutine which sets up the proper graphics mode and loads standard MICRO-PAINTER files.

Micro-Painter Files

MICRO-PAINTER allows computer artists to easily draw and save high-resolution graphics displays. When a graphic display is saved, the entire graphics memory area is saved, along with four color indicator bytes. The picture area consists of 192 lines, each containing 40 bytes, for a total of 7680 bytes. This plus the 4 bytes of color information comes to a total of 7684 bytes in a MICRO-PAINTER picture file.

"Oh," you say, "all I have to do is put these bytes where they belong in memory, and that's it?" Not quite.

As mentioned earlier, MICRO-PAINTER uses GRAPHICS 7+, a mode similar to GRAPHICS 7, but with twice the vertical resolution. In order to get the proper display, we must tell the computer to display the picture in mode 7+. Listing 1 is a BASIC program which sets up the graphics mode, reads the picture file, and sets the proper colors. Listing 2 is the assembly language source code for the picture loader subroutine, for those readers interested in machine-language programming.

Picture Perfect

Type in the program in listing 1. After it is SAVED, RUN it. The program will ask for a MICRO-PAINTER filename. Place a disk with a MICRO-PAINTER picture file on it in your disk drive and type in the filename, with the "D:" prefix. If you make a mistake, the program will ask again.

Once you enter a valid filename, the program will load the file very quickly, placing it on the screen.

While the picture is being loaded, you may notice that the colors in the picture are not correct. This is because the four color bytes are at the end of the file, and are read last. As soon as the picture is completely loaded, the colors will be changed to their proper values.

The Program

Let's look at Listing 1 and walk through the program.

Line 230 — This line sets up the string LD\$ and READS the DATA in lines 390-430 into this string. This is a machine-language subroutine which sets up the GRAPHICS 7+ screen and reads the 7680 bytes of picture information into the screen RAM very quickly.

Line 290 — Sets up a string variable to hold the picture filename.

Line 300 — Inputs the picture filename and opens the file as input. The "TRAP 300" will cause any errors to be sent to line 300. That is, if there is any error condition, the program will ask for the filename again.

Line 310 — This line actually sets up the GRAPHICS 7+ mode and loads in the picture. The "GRAPHICS 24" command sets up a full-screen GRAPHICS 8 screen, which happens to use 7680 bytes, the same as GRAPHICS 7+. The USR call "A=USR(ADR(LD\$))" converts the GRAPHICS 8 screen to GRAPHICS 7+, then reads the first 7680 bytes of the picture file into the display memory. During this operation, you will see the picture appear from the top of the screen to the bottom.

Line 320 — The USR call returns a value in the variable "A." If this value is a 1, the picture data was loaded successfully and the program continues with the next line. If the value is not 1, there was some type of error and the program goes to line 300 and asks for the filename again.

Line 330 — This line reads the last four bytes of the file, which contain the picture's color information. These values are POKEd into the color registers. At this point, the picture is completely loaded, with correct colors.

Line 340 — This line loops until the START key is pressed.

Line 350 — Once the START key is pressed, this line transfers control to line 300, which asks for another filename.

Lines 390-430 — These DATA statements are the machine-language values for the picture loader.

Using The Loader In Your Programs

The machine-language picture loader presented here is very easy to use in your own programs. Simply follow the step-by-step instructions.

1) Set up LD\$ with the machine-language sub-

routine. (Line 230)

- 2) Open IOCB #1 as input with the desired filename. You MUST use IOCB #1 or the loader will not work.
- 3) Do a GRAPHICS 24 command.
- 4) Call the machine-language subroutine with the command: **A=USR(ADR(LD\$))**

That's all there is to it!

Summary

With this subroutine, ATARI computer owners who use Datasoft's MICRO-PAINTER graphics package will be able to show their pictures in their BASIC programs. The subroutine is much faster than BASIC, and is easy to use. □

ATARI SINGS YOUR FAVORITE SONGS!!!

THE Original VOICE BOX Speech Synthesizer by the ALIEN GROUP has received rave reviews:

MICRO COMPUTING—"The VOICE BOX injects an endearing personality to your computer. The possibilities are enormous."

COMPUTE—"The VOICE BOX offers more human-like tones and does not blank out the screen."

CREATIVE COMPUTING—"English text and phonetic code may be freely intermixed rather than requiring separate modes as is the case without exception with every other speech system. A mode called talking face displays an animated face with impressive lip sync animation."

ANTIC—"There is a great potential for teaching children to spell and an added dimension to games overall. I believe the VOICE BOX is well worth the price tag."

ANALOG—"For ATARI owners who want to add speech to their programs, the Alien Group VOICE BOX is probably the best choice."

POPULAR SCIENCE—"The speech quality is excellent. Besides creating speech, the software has a bit of fun with graphics."

and on the new VOICE BOX II.....

TIME MAGAZINE—"Machine of the Year" "The VOICE BOX by the Alien Group enables an ATARI to say aloud anything typed on its keyboard in any language. It also sings "Amazing Grace" and "When I'm 64" or anything else that anyone wants to teach it.

INCORPORATE THE SINGING HUMAN FACE
INTO YOUR PROGRAMS AND GAMES

VOICE BOX II
Speech & Singing Synthesizer

To order by mail send a check or money order to the ALIEN GROUP for \$169. Then, try the VOICE BOX II for 10 days, and if it isn't the finest value you've ever seen in a computer peripheral, the most challenging and provocative addition you've ever made to your system, return it in its original condition for a full refund.

THE ALIEN GROUP
27 West 23rd Street (212) 741-1770
New York, NY 10010

The New VOICE BOX II for ATARI plugs into the serial port of the ATARI 400/800 with sound coming out of the TV/monitor. 48K DISK is required. It has all of the features of the original VOICE BOX plus many exciting new hardware and software features:

- The ability to sing with voice and 3 part music.
- A library of 30 famous songs.
- A comprehensive music system that allows the user to easily enter or modify new songs.
- Software that can convert the bottom two rows of the ATARI keyboard into a piano with a range of 3½ octaves using the shift and control keys.
- Programmable musical sound effects such as tremolo, vibrato, glissando and click track.
- A singing human face with lip-sync animation designed by Jerry White.
- A talking or singing ALIEN face with software that allows the user to change the face and 8 mouth patterns as he sees fit.
- The ability to speak with inflection and feeling.
- Can speak in a foreign language with correct foreign spelling as input.
- A talk and spell program by Ron Kramer. Users can program any vocabulary for this spelling game. In fact, this program can even speak in a foreign language like French, where the user must spell the correct word in English, or vice versa.
- GREEN GOBLINS—A talking arcade game by John Wilson.
- Random Sentence Generator—An amusing grammar game that helps teach school children to identify parts of speech and recognize a variety of sentence structures.
- NUMBER SPEAK—A subroutine by Scott Matthews that converts up to a 9 digit number into normal English pronunciation. Ideal for building your own math games.
- STUD POKER—A talking poker game by Jerry White.
- The screen never blanks out while talking or singing.
- Singing or speaking subroutines can be incorporated into your programs, requiring as little as 100 bytes of RAM plus 5 bytes for each word.
- Entries into the \$5000 talking or singing game contest can be written using the VOICE BOX II—send for contest information.
- Price \$169.00 includes VOICE BOX II and all of the above software.
- Inquire about our discounts for educational institutions.

ALSO AVAILABLE AT LEADING COMPUTER STORES THROUGHOUT THE WORLD.

ENHANCE YOUR ATARI 810

HAPPY 810 ENHANCEMENT

Speed up program development, loading, execution, and copying time by reading disks up to 3 times faster. Complete compatibility with existing software, with faster disk initialization, and reduced wear on the disk drive mechanism. No soldering or trace cutting required, complete installation instructions included, or contact your dealer. Diagnostic program included.

SOFTWARE ENHANCEMENTS (require HAPPY 810 ENHANCEMENT)

HAPPY BACKUP PROGRAM

Guaranteed to produce executable backup copies of any disk which can be read with a standard ATARI 810* disk drive. Backup those important disks in your library or use HAPPY BACKUP for small scale software production. Completely automatic duplication of format and data content of the source disk. Single and multiple drive versions available. Backup copies will work on a drive without the enhancement.

HAPPY COMPACTOR PROGRAM

Combines self booting programs which reside one per disk into one disk with many self booting programs using the HAPPY COMPACTOR file structure. Programs are then executed from the self booting HAPPY COMPACTOR menu, and may later be extracted back onto a single disk. Compacted programs disk will execute only on a drive which has the HAPPY 810 ENHANCEMENT. Pays for itself by reducing the number of backup disks you need, in addition to the added convenience.

HAPPY CUSTOMIZER PROGRAM

User friendly program to generate source disks with custom track format. Format is specified on a per track basis. Examples of usage and interpretation of results are included. This system requires a more advanced level user.

HAPPY 810 ENHANCEMENT WITH SINGLE DRIVE HAPPY BACKUP \$249.95
 MULTIPLE DRIVE HAPPY BACKUP PROGRAM \$ 49.95
 HAPPY COMPACTOR PROGRAM \$ 49.95
 HAPPY CUSTOMIZER PROGRAM \$ 99.95

CALL OR WRITE FOR ORDERING INFORMATION. Sorry, no COD or credit cards accepted. Dealers may inquire, send letterhead.

80 COLUMN COLOR VIDEO BOARD FOR THE ATARI 800™

IF YOU USE YOUR ATARI 800™ FOR:

- PROGRAMMING
- TERMINAL COMMUNICATIONS
- WORD PROCESSING
- DATA BASES

**THE AUSTIN 80™ COLOR VIDEO BOARD GIVES YOU
THE OPTIMUM FEATURES...**

- 80 * 25 Character Screen
- 256 Character set with line and box graphics
- Underline, blink, reverse, half intensity
- Smooth scrolling
- 16 color RGBI or RGB outputs ± composite video
- Uses medium resolution B&W or color monitor
- Fits in last slot of 800
- Light pen input

LIST PRICE \$279⁹⁵

SOFTWARE TO MAKE OPTIMUM USE OF THE AUSTIN 80™

SMART TERMINAL — EMMULATES DEC VT100™ — \$19⁹⁵

**WORD PROCESSOR with CONFIGURABLE PRINTERS
SUMMER '83**

OPTIONAL RGBI OUTPUT CABLE — \$34⁹⁵

AUSTIN 80™ CARRIES A 1-YEAR PARTS AND LABOR WARRANTY

Ask for AUSTIN BOARDS™ at your local dealer or call

EXPANSION DEMO

16K cassette 24K disk

by Andrew Katz

After seeing the expansion of crystals in a TV film, I wanted to see if I could simulate that beautiful event using my ATARI. The graphics demonstration program presented in this article does just that. Type Listing 1 into your computer and check your typing accuracy by using C:CHECK or D:CHECK. If you don't have either CHECK program, be sure you SAVE the expansion demo before running it.

After the program is entered, RUN it. You will see 15 different-colored "seeds" appear. These seeds will gradually begin to grow into larger groups of pixels, all pixels in a group being the same color. The shapes will grow until they collide with a different-colored group, at which time they will stop growing. Those shapes lucky enough to avoid early collisions will become the largest. Eventually the screen will become solid with color, resembling a colorful map. Pressing the START key will start the process again from the beginning.

The BASIC program provided (lines 70-110) can be changed to build other scenarios. Experiment with other graphic modes, make line drawings and watch them grow together, and so on.

There are several parameters which can be changed to give different effects. These parameters are in lines 1000-1040. The 3 in line 1040 controls the rate of expansion. Change it to a 2 and RUN the program. Now the rate of expansion is many times quicker. You will notice holes appearing as the shapes form. These holes fill soon and the shapes stay completely well formed. Change the 3 to 1 and the expansion will look like a boiling pot!

Why GTIA? Well, GTIA modes are the easiest to program, and of course they give the most color. This program will work for those without GTIA, but the colors will be different. I am told that all ATARI computers sold in 1982 and after have the GTIA. I recommend that anyone without a GTIA chip get

one from ATARI. They cost only \$22 and are easy to install (see "Installing Your Own GTIA Chip" in A.N.A.L.O.G. #10).

I have provided the assembly source code listing (Listing 2) for those interested in seeing how the expansion works. In each cycle, a pixel is chosen at random. Note that I have cut the Y resolution in half to get a more even aspect ratio. Once the pixel is chosen, a neighborhood around the pixel is read (see FIGURE 1). The neighborhood is then reordered into a clockwise loop (one for pixels with an even X coordinate, and one for an odd coordinate). If the pixel chosen is uncolored AND there are 3 pixels in a row with the same color surrounding it, the pixel is plotted with that color. Otherwise it is left alone. That's all there is to it. If you have any questions or suggestions, contact me at 9 River St. Ext. 158, Little Ferry, NJ 07643.

Figure 1
One Neighborhood

4	5	6
8	9	10

IF XPOS EVEN

1	2	3
5	6	7
9	10	11

Editor's Note

Our programming staff has come up with an interesting modification to the expansion demo. First, change the 3 in line 1040 to a 1 to speed up the program execution. Then enter the following program lines and type RUN.

```
80 COLOR 8:FOR I=1 TO 37
82 REM
111 COLOR 2:FOR I=1 TO 13
112 Y=INT(RND(0)*92)+1:X=INT(RND(0)*78)
113 PLOT X,Y*2:DRAWTO X,Y*2+5
114 NEXT I
```

This modification changes the 15 different color "seeds" to 2 colors, blue and orange. There are approximately 75% blue seeds and 25% orange, roughly the same proportions as areas of water and land on the earth. When the modified expansion demo is RUN, it will produce a display that looks remarkably like a planet's surface! Make your own modifications and see what you can come up with.□

If you are serious about personal finance...

- **Budget Forecast**—26 expense categories
- **Check Entry**—easy data entry—scan & modify 26 major & 36 sub-categories—information block
- **Check Search**—single or multiple parameters—(up to seven) to search entries
- **Tabulations**—detailed expense vs. budget comparisons by month, year-to-date, category
- **Bar Graphs**—screen displays in graph form expenses vs. budget—by month or category—printing with graphic capable printers
- **Check Reconciliation**—fast clearing of resident checks & deposits, complete summary report
- **Checkwriter**—prints your custom checks
- **Printouts**—most popular printers
- **Multi-Colored Graphics** • **Audio Enhancements**
- **7 Utility Programs** • **User-Friendly Operation**
- **Easy To Use Instruction Manual** • **Audit Report**
- **Handsome Tinted Plastic Storage Case**

COMPUTE!

The Leading Magazine Of Home, Educational, And Recreational Computing

In a feature editorial.

"If you want to use a finance system, but don't want to spend several days trying to learn how to use one, then A Financial Wizard by Computari may be just what you need."

"The illustrated manual that comes with this program is clear, direct, and very thorough."

"It appears that this finance system was designed to achieve the best and most comfortable working relationship between the user and the program."

"The check entry routine is the most attractive feature of this finance system. Data prompts are very clear and the category item names are displayed at all times during data entry for your convenience."

"The file search capabilities of this program are superior. You are offered seven ways to look up the checks."

"The system is disk intensive. All data is saved automatically and immediately following all routines that either enter data or modify it."

"Scanning your entries is made possible by pressing START. You can see records very quickly this way."

"This is an excellent finance system—entertaining, accurate, and fun to use."

ANALOG COMPUTING

THE MAGAZINE FOR ATARI COMPUTER OWNERS

Analog Magazine in a comprehensive study of personal finance systems for Atari* computers.

"A Financial Wizard from Computari is by far the best of these programs and will be the standard of comparison for the others."

"The check entry mode is easy to use..."

"The way a Financial Wizard handles your tabulations is excellent. You can chart your actual expenses vs. your budget by month, by category or year to date."

"...where it really outshines the rest is in the check reconciliation."

"In effect it gives you your bank statement on the screen, a complete list by month of all your checks and deposits."

"A Financial Wizard has one disk that does everything..."

"Graphics, while really not a factor in the quality of programs of this type, do make your budgeting chores a little more pleasant. Again A Financial Wizard comes out on top."

"Everything about this program is excellent..."

Antic

The ATARI Resource

In a Report from Antic.

"Like most Atarians, I am captivated by the graphic, color and sound capabilities of my machine. Nothing quite discourages me more than to boot up an applications program (personal, business, etc.) and to be presented with the standard graphic 'o' white characters on a blue screen."

Of course the usefulness and effectiveness of a program is of primary importance. However, enhancing the dullness of applications programs with some of Atari's charms, is a great asset. A Financial Wizard, a personal finance program by Computari's Bill McLachlan, is an excellent example of an applications program that integrates many of the Atari's features into a well conceived and executed program."

"The use of color and sound in the data input prompts and error checking routines are so well done that it's quite simple to boot up the disk, follow along with the very clear documentation, and be 'up and running' in short order."

"I give A Financial Wizard high marks in ease of use, documentation and performance. If a disk-based home finance package is in your future, The Wizard should get serious consideration."

Computari's A Financial Wizard 1.5 The logical choice.

The system is designed for Atari computers having a minimum of 32K and operating from a disk drive. The cost is only \$59.95 plus \$3 for handling/postage.

If your dealer does not have A Financial Wizard... Telephone orders are accepted on Mastercharge or Visa credit cards. Mail order must be accompanied by check or money-order or credit card #.

EXPAND YOUR ATARI 810®

NEW - The CHIP with ARCHIVER Software

Create custom formats, edit and disassemble sectors, back up **any** disk automatically. Supports multiple copies and multiple drives. The ultimate utility. \$99.95 plus \$4 shipping. Call for optional installation.

MIGHTY BYTE DISK COPIER

An economical but effective sector copier which creates bad sectors in two ways. \$29.95 plus \$2 shipping.

SPEED KIT

Slow down your Atari (Tandon) drive as necessary. \$5.00 or \$10.00 plus shipping installed.

We offer complete service on Atari Disk Drives.

Coming soon . . . The ultimate cartridge back up.

VISA & MASTERCARD call now

THE NEW ATARI COMPUTERS!

by Lee Pappas

In recent months Commodore has slashed the prices on their VIC-20 and 64 computers. The Texas Instruments 99/4A price tag reads like a novice's score on Donkey Kong. As one of the editors of **A.N.A.L.O.G.**, it's amazing how much worry I sense from most ATARI (and even non-ATARI) owners. What is ATARI going to do?

Well, for starters, 4 (four!) new computers have been announced: the **600XL**, **800XL**, **1400XL**, and the **1450XLD**. These represent ATARI's new main line of CPUs. All resemble the modern styling set forth by the 1200XL, all units have serial and processor-bus interfaces on the back, and all are still 8-bit machines.

600XL

The **600XL** is scheduled to retail below \$200 and is shipped with 16K of RAM, upgradable to 64K using an expansion module from ATARI(!).

Then there is the **800XL**, which comes with 64K and should be priced around \$300. There are even rumors of third-party companies releasing memory modules to increase RAM to 192K. The **1400XL** is also a 64K machine, with the addition of a built-in modem and voice synthesizer. (Great stuff!) This CPU should sell for about \$500.

800XL

1400XL

The new flagship (flagcomputer?) of the ATARI line is the **1450XLD** (whew!). This too is a 64K machine with a BUILT IN double sided/double density disk drive, modem, and voice synthesizer. But that's not all... The disk drive data-transfer rate is 2 1/2 times faster than the 810 drive, and there is room in the **1450XLD** to add another similar drive. I feel the most incredible feature of this unit is the price — scheduled to be under \$1000; probably at **\$899!** At this time there is NO OTHER computer on the market that can match the feature-to-price capability of this computer.

1450XLD

The **600XL** should be on your dealer's shelves by September, followed by the **800XL** later in the month, and the **1400XL** and **1450XLD** in the fourth quarter. All four machines are fully compatible with the 400/800 — even more so than the 1200XL is. Also, all of the operating system bugs in the 1200XL format have been removed. Rumors are that the 400, 800, and even the recently released 1200XL will be phased out as the new machines become available. However, ATARI promises that all of the new software will work on the current machines.

That's Not All, Folks

Along with the new computers comes an array of interesting new hardware with comparable styling. In issue #9 of **A.N.A.L.O.G.** we mentioned the **ATARI 1020 COLOR PRINTER/PLOTTER** and the **1025 80 COLUMN PRINTER**. Newly announced is the **1027 LETTER QUALITY PRINTER**. This is NOT a dot matrix printer, but a high quality print style with a cylinder/impact print head. The price should be under \$400 (read \$349). Print speed runs at 20 characters/second, however at this price and print quality, that slowness shouldn't be an important factor.

To complement the new **1010 PROGRAM RECORDER** is the **1050 DISK DRIVE**, originally to be shipped with DOS II, then later in the year with DOS III which allows the drive to run at double density. Incidentally, DOS III utilizes the

HELP key (a feature all of the new computers have) to assist in DOS III menu selection. The printers and storage devices will also work on the 400/800/1200XL computers.

The new **EXPANSION MODULE** boasts 8 ports, along with 2 RS-232 hookups and a bi-directional parallel interface.

Many of us have been craving for the ability to run CP/M programs on the ATARI computers. The new **CP/M EXPANSION MODULE** works with all the current and soon to be released computers with the exception of the 400. The unit will probably hook up through the serial line. This module allows you to run an incredible number of professional and high-quality business programs on the ATARI.

Another new piece of hardware the **1030 DIRECT CONNECT MODEM**, featuring auto-dial from the keyboard, autoanswer, and pulse and touchtone dialing modes. The new modem also includes a memory buffer and printer on/off switching. The 1030 works with both Telelink I and II.

The new **CX60 SUPERJOYSTICK** is self-centering and is made of high quality contact switches with 2 firing buttons (for right or left handed users). The **CX40** is a **REMOTE CONTROL** joystick, and the **CX80** is a **TRACKBALL** controller replicating those in the arcades. A new type of "controller," the **CX77 TOUCH TABLET** allows you to use either a pen or your finger to draw or input data to the computer. This supplements the **CX85** numeric keypad already on the market. A lightpen may also be available in the near future.

Again, with few exceptions, all of this hardware will work with the 400/800/1200XL. ATARI has also announced the availability in the near future of their own 48K RAM board for the 400. If ATARI starts filling in the gaps (especially in the memory department—see editorial in issue #11) this will leave the 3rd party companies, which up to now developed 400/800 expansion memory boards, out in the cold.

Next issue we will report on other new announcements from the Summer Consumer Electronics Show in Chicago. Fear not, loyal ATARI fans, the computer age is just beginning and ATARI is ready to lead the way. □

IN A GALAXY OF SOFTWARE STARS, WE'RE THE ONE TO WATCH.

VARICOMMANDER

PMI is proud to announce the release of VARICOMMANDER! This is a state of the art variable manipulator for the Atari computer (400/800/1200), and an *extremely powerful* programming utility! VARICOMMANDER allows you to change any variable name to any other name you wish. With another option you can change *all* variable names to any names you wish. Other options include: automatic generation of one character names, automatic generation of two character names, all variables one name (Atascii character), or you can even rename all variables in your program automatically to two character names and retain string and dimension variable integrity. VARICOMMANDER is ergonomically designed with extensive error protection to save your valuable time. If you're a novice or an advanced programmer, VARICOMMANDER is for you!! VARICOMMANDER requires 32K RAM, BASIC cartridge and at least one Atari 810 (or equivalent) disk drive. (Will accommodate multiple disk drives.) \$29.95.

PROGRAMMIN' STUFF

is a utility package for the basic programmer! The package contains: the

PMI RENUMBER utility, the PMI BASIC CRUNCHER - program compacter, BASICDOS - gives you the most commonly used DOS functions from BASIC, PMI AUTORUN system - allows you to create your own AUTORUN. SYS file using up to a 50 character BASIC statement, the PMI RPM TEST - disk drive speed utility, the PMI PROGRAM SELECTOR - allows you to run any BASIC program by selecting a number off the menu, and the PMI PROGRAM ANALYZER - will list all variables in your program, how much RAM it occupies and line numbers that the variables first appear in. For full utilization of PROGRAMMIN' STUFF you should have at least 32K RAM, BASIC cartridge and one disk drive. Some *powerful* utilities for the basic programmer at a price you can live with — ONLY \$26.95!

REPLICATOR SERIES

Still available from PMI - REPLICATOR ONE and REPLICATOR TWO - disk back-up utilities. REPLICATOR ONE - single disk drive. REPLICATOR TWO - dual disk drives. Requirements: 32K RAM, BASIC cartridge and disk drive(s). \$34.95.

**DEALER INQUIRIES
INVITED**

BRINGING COMPUTERS DOWN TO EARTH.

SPECIAL OFFER

VARICOMMANDER and PROGRAMMIN' STUFF - only \$45.95.

PROGRAMMERS!

If you have written a program that is technically sophisticated and also "user-friendly", PMI would be interested in publishing your work. For information on how to submit your material write to: PMI, P.O. Box 2895, Winter Park, FL 32790-2895, Or phone (305) 644-3822.

PMI, 2500 Lee Road, Suite 210 P.O. Box 2895, Winter Park, FL 32790-2895

SOUND EFFECTOR

16K cassette 24K disk

by Sheila Neece Spencer

After spending countless hours experimenting with sounds on my ATARI, I finally got tired of running the cursor back and forth to make changes in pitch, distortion, loops, etc. And almost invariably when I got a sound I really liked, I found I had no way to get it back — since I had been experimenting in immediate mode and had carelessly let the sound statements scroll off the top of the screen!

I got just as tired of writing short programs for sound generation — so instead I wrote the Sound Effector, which does all the work for me — and shows me exactly what program made that terrific sound.

The program is quite straightforward. You are asked to input values for pitch, distortion, and volume. (If you intend to run any of these values through a loop, you may enter any number you wish at this point.)

You will then be asked if you want any loops. If you respond with a "Y" to any of the loops, you will be asked for "FROM" and "TO" values, as well as a "STEP" value.

The program runs the values, with loops, and if you have used more than one loop, informs you which loop is the inner one and which the outer. You should make notes of this in case you like what you hear and want to use it in another program. After each sound you will be asked if you want to hear the sound again. An "N" will allow you to see the values you used — on your screen or printer. You can then go on to the next sound (or automatically to the next loop configuration) or end the program.

I've enjoyed experimenting with the program, and have come up with some pretty interesting sounds that I'm sure I wouldn't have gotten working in my usual haphazard way! □

Great Software • Great Service • *incredible* Great Prices

from Sierra
On-Line
Frogger

16K Tape / 32K Disk **\$22.88**

The official Atari computer version of the smash coin-op hit. Beautiful graphics. The disk version features seven different tunes.

All Sierra On-Line programs, including Ulysses & The Golden Fleece and The Wizard & The Princess in stock and available at similar savings.

from Thorn-EMI
Soccer

ROM Cart. **\$34.88**

In our opinion, this is the best arcade sports game available today. Play vs. the computer or human opponents. Fantastic graphics.

All Thorn-EMI Cartridges including Submarine Commander and Jumbo Jet Pilot in stock and available at similar savings.

from SSI
The Cosmic Balance

48K Disk **\$26.88**

Design and build starships, then battle it out in this combination strategic/arcade offering from SSI's Rapid Fire series.

All SSI programs including Knights in the Desert, The Cosmic Balance II and Tigers in the Snow in stock and available at similar savings.

from Epyx
**Crush,
Crumble
& Chomp**

32K Tape or Disk **\$19.88**

Take on the persona of any of six demonic horror-film beasts (or create your own on disk). Then, pick out a mouthwatering metropolis and head for those buildings and bridges.

All Epyx programs including Jumpman, Temple of Apshai, and Monster Maze in stock and available at similar savings.

from Broderbund
Bank St. Writer

48K Disk **\$49.88**

If you own a disk drive, but haven't yet acquired a word processor because the programs you've investigated are too complex and/or expensive for your needs, this program should excite you. Developed at the Bank Street School, it's surprisingly powerful and perfect for students and first-time users.

All Broderbund Software including AE, Choplifter and Stellar Shuttle in stock and available at similar savings.

from Infocom
Suspended

32K Disk **\$33.88**

While in a state of cryogenic suspension, you control six robots with different personalities and abilities, as they respond to "incidents" occurring at various locations of the underground complex around you. A game board is included. Plan on spending over 50 hours with this masterpiece of strategic gaming.

All Infocom programs including Zork I, II, and III, Deadline and Starcross in stock and available at similar savings.

from Lightning
Mastertype

32K Disk **\$25.88**

A breakthrough in interactive educational software. Learn to type as you battle wave after wave of invading words riding in hi-res spaceships! 17 pre-programmed lessons, plus others that you can create, guarantee continuous challenge and help you develop mastery of the Atari Keyboard.

from Thorn-EMI
**Home
Financial
Management**

16K Tape **\$19.88**

Set up a budget and then see where you stand financially either in figures or through bar charts. This program should pay for itself!

All Thorn-EMI tapes including Figure Fun available at similar savings.

from Datasoft
Zaxxon

16K Tape or Disk **\$25.88**

The long-awaited version of the 3-D arcade hit of 1983. A must-have game for the space gamer.

All Datasoft programs, including Sands of Egypt and Text Wizard available at similar savings.

from Spinnaker
**In Search of the
Most Amazing
Thing**

48K Disk **\$26.88**

The newest program from Tom Snyder, author of Snooper Troops #1 and #2. Bargain with aliens at an auction, raise currency, then buy your provisions and board your specially-equipped B-Liner in search of the Most Amazing Thing. It's educational — and it's fun. Free bonus novelette included.

All Spinnaker software including Facemaker, Story Machine and Snooper Troops #1 and #2 in stock and available at similar savings.

from MUSE
**Castle
Wolfenstein**

48K Disk **\$18.88**

One of the most popular games ever released for the Apple is now available to you. Try to find the war plans and escape from the Nazi stronghold in this exciting blend of strategy and arcade action.

from Sirius
Bandits

48K Disk **\$22.88**

Bouncing nerve gas balloons, energy shields, space bandits attempting to steal your supplies — they're all on the screen in one of the best space arcade games yet.

All Sirius Software including Repton, Way Out and Sneakers in stock and available at similar savings.

Prices good thru July 30, 1983

DE RE LETTER PERFECT

(almost)

by Arthur Leyenberger

Letter Perfect by LJK has become the premier word processor for the ATARI computer for many reasons. One particular reason is its versatile ability to be used in conjunction with just about any printer imaginable. With this flexibility, however, comes complexity. My goal is that this article be helpful to the first-time user of LJK's Letter Perfect (LP) word processor. I am using LP right now with the Bit-3 80-column board and a green phosphor monitor, and although I have only had the program for a short time, I like it. However, the first few times I used the program I had fits. Hopefully, by sharing my experiences, you will be spared the hassles and your first attempt at using LP will be a successful one. Also, I will present information on using the disk printer editor to configure a printer driver for the NEC 8023 and C. Itoh 8510 (Prowriter) printers.

First, LP does not use ATARI DOS, consequently disks that have been formatted with DOS will not work with LP. Therefore, you must format a disk using the Format Disk option of the main menu. Before you even get to that point, there are a few things that first need attending to. For you folks (like me) who have the disk version of Letter Perfect, turn the computer off and the disk drive on, remove any cartridge from your computer and boot up the LP disk (not the disk marked "disk printer editor" - I'll get to that in a while) by inserting the LP disk into the disk drive, closing the door and switching the computer on.

You will now see a cryptic prompt: "(EADQ)." The E, A and Q represent Epson, ATARI 825 (or Centronics 737 or Centronics 739), and Qume or Diablo printers, respectively. If you are using one of these printers, press the appropriate key, otherwise press D which stands for disk printer editor. For now, the best approach is to press D and then press return. The next two questions refer to which disk drive will contain your files and which will contain your database (if you are doing a mail merge). Since I only have one drive, I press return after each of these questions for the default option of 1 disk drive. Now you will see the main menu. The "<" key scrolls the menu pointer up to the top of the screen and the ">"

scrolls the pointer down to the bottom of the screen. When using either key and the top or bottom has been reached, the pointer wraps around to the opposite end of the menu. Once you have positioned the menu pointer to the desired selection, you must then press the return key to actually request that option.

Let's assume you have formatted a disk, this disk is now in your drive, and you are still looking at the main menu wondering what all this stuff means. The most often-used menu options are Editor, Load, Save, Printer and Change Parameters.

To get started using the program, position the menu pointer to the Editor option and press return. You are now faced with a blank screen. The first line of your text should always be a format line. The format line is begun with a control-F, (it will appear as inverse video) and it allows you to set margins, fonts, line spacing, headers and footers and other things. If you don't specify a format line, the program will use default values for all of these (see page 33 of the LP manual for more information). I always use a format line because I want to know what the values of these options will be.

I will mention just a few options and their values to get you started. Assume your paper is 8- 1/2 inches wide and you want a one inch left and right margin. Also, you will be using pica print (which is 10 characters per inch or 10 pitch.) You should then specify the left margin (m) as 10 and the line width (w) as 65. Remember, 10 characters/inch, so a one inch left margin equals 10 characters. Likewise, a 65 character width will be equal to 6-1/2 inches. There is no need to specify the right margin since what ever remains from 8-1/2 inches automatically becomes the right margin.

Another useful option is line spacing (l). Line spacing may be from 1 to 5 lines. For term papers, business reports and articles submitted to magazines, use a line spacing of 2. For letters, use a line spacing of 1. Finally, if you want your text printed with right justification (as in this magazine, or simply to look nice) then use the justify option (j) with a value of 1. A value of 0 means no justification. These options

and all others are specified by pressing the lower case letter representing the option followed by the value. The following is the above mentioned format line as it would appear as the first line of your LP file. (The underlined F represents a control-F).

Fm10w6511j1

Be sure to press return after this first line. You are now ready to begin typing. Just remember that, unlike a typewriter where you press return after each line, in LP you just keep on typing and only press return at the end of a paragraph or where you want to end a specific line on the printer. Once you have finished typing your text (or about every five minutes worth of work), you should press the escape (ESC) key which will bring you back to the main menu. Then, position the menu pointer to the Save option, and press the return key. Now type a file name of up to 8 characters in length. You can not use a file name extension because Letter Perfect automatically puts an ".LP" at the end of your specified name. After the file has been saved, LP places you back at the main menu. Loading a file from disk is done in a similar way. Don't forget, when you are in the Editor mode, pressing the (ESC) key brings you back to the main menu and when you are in the main menu mode, you make your menu selection via the "<" or ">" keys and then pressing return.

So far I have talked about the main menu, the Editor mode, and loading and saving files. I will now discuss how to print your text on your printer. First, configure the disk printer editor with the specific codes that are required by your printer. It is a relatively straightforward procedure. What you are doing is setting up a little file on your disk (the disk that will hold all of your text files). The print driver tells LP what ASCII codes to send to your printer to do specific things. For example, on my C. Itoh printer the underline-on and underline-off codes are 27,88 and 27,89, respectively. Once this has been specified to LP, I simply use a control-U to toggle the underline on and off within my text.

Now that you know **what** you are doing, let me briefly tell you **how** to do it. Boot up the Disk Printer Editor Disk and answer the question as to what type of printer you have (read pages 76 through 88 in the LP manual at least once before you attempt to do this). Note that item 5, NEC, refers to the NEC Spinwriter printers, not the NEC 8023 dot matrix printer. Generally, the way this process works is for you to select a numbered option, press the return key and then change or enter the values associated with that printer function. You then press the return key to save those values and continue.

When the main menu comes up I select option 6 because I have a C. Itoh 8510 Prowriter printer. I am then given an opportunity to change some default values concerning things like margins, type fonts, etc. Pressing return instead of an option number

brings up the next questions. I then accept the default values for double width printing and back-space character by pressing return twice. The program then asks for boldface on/off and underline on/off. I respond with the codes — 27,33/27,34 and 27,88/27,89, respectively. I now press return and come to the font questions. Up to four fonts may be described and they are numbered 0 through 3. The following are the fonts I can use on my printer and their codes: Pica (10 pitch) — 27,78; Elite (12 pitch) — 27,69; Condensed (17 pitch) — 27,81; and Proportional — 27,80. I press return once more and then I make sure my file disk is in the disk drive. Then I press shift-3, which records the above information on the disk and returns me to the Disk Printer Editor main menu once again. At this point I could configure another printer driver but I would have to answer all of the questions all over again. It would have been nice if my previously entered values remained, allowing me to modify just what I need to in order to configure another printer driver. By the way, only one print driver may be stored on each side of the disk.

When you are finished with the Disk Printer Editor, you'll want to return to the Letter Perfect program to actually print the masterpiece. To do this, insert your LP disk in the drive and select menu option 7 (exit) and follow the instructions. When the prompt (EADQ) appears, insert your file disk containing the printer driver, press D and then press shift-3. This will load the printer driver. For a one-drive system, press return twice and select the Load menu option. When LP requests it, type in your text file name and press return. You can now go back to the Editor mode to add, delete or modify your text or, if you want to print it, select the Printer menu option. Press return twice, adjust the paper and press return again. Your text is now printing on your printer. If not, ensure that your printer is on, it is in the select mode, it is connected correctly to the 850 interface, the interface is on and connected correctly to your ATARI computer. From now on, when you see the "EADQ" after booting up LP, insert your text file disk, press "D", and then press "#". This will load your printer driver which will be active for the entire session or until changed.

This article may have seemed a bit long-winded, but had I the advantage of reading the information contained herein when I first started using LP, I would have saved myself many hours of frustrating trial and error activity. There is much I have not covered in this article but this outline should at least get you started. The bells and whistles can come later. I am still learning too. As yet I can't do sub- and superscripting and right justified proportional printing. I also seem to have trouble with my paging, after altering the top and bottom margins when using a header. I'll just have to keep working on it. □

ATARI

PUZZLE

by Marcy Caruthers

Here is a little word search puzzle incorporating some elementary and some advanced words for your ATARI vocabulary. (Answers on page 93)

WHAT IS D:CHECK/C:CHECK

Most program listings in **A.N.A.L.O.G.** are followed by a table of numbers appearing as DATA statements, called "CHECKSUM DATA." These numbers are to be used in conjunction with D:CHECK, which appeared in issue no. 10, and C:CHECK, which appeared in issue no. 11.

D:CHECK and C:CHECK are programs by Istvan Mohos and Tom Hudson. They are designed to find and correct typing errors when entering programs from the magazine. For those readers who do not have a copy of either article, send a pre-addressed, stamped, business-sized envelope to:

D:CHECK ARTICLE
P.O. BOX 23
WORCESTER, MA 01603

CONTROL CHARACTERS

Some program listings reproduced in **A.N.A.L.O.G.** may contain "strange" characters not shown on the ATARI keyboard. These are special characters which use the CTRL, ESC and "ATARI LOGO" (INVERSE) keys. Shown below is a list of these characters and the keystrokes used to get them. □

ATARI® 400 or 800 OWNERS

INTRODUCE YOURSELF TO THOUSANDS OF NEW PROGRAMS

PLUG IN A FLOPPY DISK DRIVE FOR LESS THAN \$550.00

There are thousands of programs available only for computers with floppy disk drives. Micro Mainframe is proud to introduce our floppy disk drive system for the Atari® 400 and 800 computer systems. Our disk system provides the best features at the lowest price available.

STANDARD FEATURES:

- Comes complete and ready to run*
- Double density operation without patches to Atari® DOS
- Single or double density operation software or hardware selectable
- Printer port for standard Centronics parallel printers
- Eliminates the need for the 850 Expansion Interface
- 4K Printer spooler expandable to 38K
- Can be used with all your current Atari® peripherals
- Add additional drives for less than \$300.00
- Supports double sided and 8" floppy disk drives**
- MMF hard disk expansion drives available
- Reads all protected software disks
- Digital Phase Locked Loop Data Separation
- 90 Day factory warranty

With the addition of our expansion box, you can turn our disk drive into a full 64K Z-80® computer using your Atari® as a color terminal allowing you these additional features:

- Run CP/M® software
- Run TRS-80 Model II® software
- Run Oasis® software
- Full 64K Z-80® computing power
- Multiuser operation***

YOU'LL AGREE WITH EVERYBODY ELSE THAT MICRO MAINFRAME IS YOUR BEST BUY IN PERIPHERALS FOR YOUR ATARI® 400 OR 800

Dealer Inquiries are Solicited
MICRO MAINFRAME
11325 Sunrise Gold Circle, Bld. A
Rancho Cordova, CA 95670
(916) 635-3997

* Atari® DOS required

** Requires Maxi-DOS A* (available mid '83)

*** Requires Oasis® Software

Price and specifications subject to change without notice.

NOTES TO THE ATARI MICROSOFT BASIC INSTRUCTION MANUAL

by Gerald L. Despain

Rare indeed in the computer industry is the user's manual that answers every question. I have been using the ATARI Microsoft BASIC product for some time now. This is a good product that provides many advantages over the original 8K ATARI BASIC. The manual is good, but it does leave some unanswered questions. I have made a number of corrections, additions or notes in the margins of my manual. I believe these will be useful to others with this product.

The following comments apply to the manual CO16083-26 Rev. 1, documenting version 1.0. One errata sheet (printed on golden rod paper) has been issued by ATARI. Beware! Some of these notes may be documenting bugs that may be corrected or features that may be changed in future versions of the software. Where a note applies will be specified by the page number and the number of centimeters down the page from the horizontal rule at the top of each page. □

Inside front cover

Insert index to DEFSNG 10, DEFDBL 10, DEFINT 11, and DEFSTR 13.

Page 15, insert at centimeter 12:

If a relationship is false, a zero number will result. If a relationship is true, the number -1 will result. The actual non-zero value may be important in some expressions involving logical operators.

Page 17, change at centimeter 5:

If it is a binary 0 (all bits off) it becomes a binary -1 (all bits on) after this logical operation.

Page 17, insert at centimeter 14:

Note: The results of expressions involving logical operators do not always follow one's intuition. For the IF statement, zero means false and non zero means true. However, if $A\% = \&0001$ then $A\%$ is true but, since $\text{NOT } A\%$ is $\&FFFE$ (all bits on except one) then $\text{NOT } A\%$ is also true. Similarly if $A\% = 1$ and $B\% = 2$ then A is true, B is true, but $A \text{ AND } B$ is false. Thus, if a variable is to be used as a switch variable in operations like IF $A\%$ and IF $\text{NOT } A\%$, then the value -1 should be used for true.

Page 30 insert at centimeter 15:

If any change is made to the program, it cannot be CONTinued. All variables will have been reset, including COMMON variables.

Page 34 change at centimeter 9:

Format: ON ERROR (GOTO) line number

Page 36 insert at centimeter 5:

The following example illustrates using RESUME from direct mode:

```
10 ON ERROR 40
20 OPEN #3,"P:" OUTPUT
30 GOTO 50
40 PRINT "Enable printer, then type RE
SUME":STOP
50 !
```

Page 38 insert at centimeter 21:

Space for only one character set can be allocated using OPTION CHR1 or CHR2. Invoking a second OPTION CHRn invalidates the previous OPTION CHRn.

Page 39 insert at centimeter 4:

Only one reserved area may be allocated with OPTION RESERVE. Invoking a second OPTION RESERVE invalidates the previous RESERVE.

Page 39 insert at centimeter 19:

Care must be taken in doing arithmetic on addresses returned with VARPTR. When using integer variables, addresses from hex $\&0000$ to $\&7FFF$ are positive integers. Addresses from $\&8000$ to $\&FFFF$ are negative integers. Adding an offset of say $\&20$ to $\&7FF0$ will cause an overflow error. The following illustrates one way to do address arithmetic and avoid overflows:

```
10 ! Illustrate address arithmetic
15 ! test mod routine
20 BX=&1000: CX=A%:GOSUB 250:GOSUB 90:P
RINT CX;C$
25 ! test add routine near 32K
30 FOR BX=-4 TO 4: CX=&7FFE:GOSUB 1700:
GOSUB 90:PRINT BX;CX;C$:NEXT BX
35 ! test add routine near 64K
40 FOR BX=-4 TO 4: CX=&FFFE:GOSUB 1700:
GOSUB 90:PRINT BX;CX;C$:NEXT BX
50 END
60 !
70 ! this routine converts the value i
n CX to hex in C$.
```

```

Page 86 insert at centimeter 18:

Mathematics of Music

A above middle C is standardized at a frequency of 440 Hz. Ideal tuning (or temperment) for other notes would yield a maximum number of consonant chords. Mathematically, no perfect tuning exists. Different compromises lead to different temperments. The most common temperment used now is equal temperment (all twelve notes equally spaced).

Using equal temperment, frequencies for notes can be approximated by the following. To be consistent with the Music Composer Cartridge, let the notes be numbered with C being 1, C# being 2, . . . , and B being 12. Let the octaves be numbered so that octave 4 begins with middle C., octave 5 being the next higher octave. The formula below approximates the pitch values:

$$\text{INT}(.5+2 \text{ (11-OCTAVE-NOTE/12)})$$

The frequency for a given pitch value can be given by:

$$\text{FREQUENCY}=63921/(2 \times (\text{PITCH}+1))$$

or

$$\text{FREQUENCY}=440 \times 2^{((\text{NOTE}-58)/12+\text{OCTAVE})}$$

Using the SOUND command, frequencies from 125 Hz to 32KHz can be played. However, because of the resolution of the frequencies, only the musical notes from C of octave 3 thru C of octave 6 can be played accurately enough to "sound right." However, by using POKE commands, higher resolution frequencies are available. This makes available the complete range of the piano keyboard. This is accomplished by combining two voices into one (reducing the total number of voices available). The following example illustrates this technique. It combines voices 1 with 2 and 3 with 4 to provide two high resolution voices.

```
10 DEF FH(F)=INT((1789790/(2*F)-71)/256)
20 DEF FL(F)=INT((1789790/(2*F)-71) AND 255)
30 PRINT "Frequencies";:INPUT F1,F3
40 DISTORTION=10:VOLUME=8
50 POKE &D208,&78 ! Merge channels 1,2
  and 3,4; use 1.79 MHZ clock
60 POKE &D203,0:POKE &D207,0 ! turn of
```

```
f sound before changing freq. to prevent warbling
70 POKE &D208,FL(F1):POKE &D202,FH(F1)
! set channel 1,2 frequency
80 POKE &D204,FL(F3):POKE &D206,FH(F3)
! set channel 3,4 frequency
90 POKE &D203,DISTORTION*16+VOLUME ! turn on channel 1,2
100 POKE &D207,DISTORTION*16+VOLUME ! turn on channel 3,4
110 GOTO 30
```

Page 111 insert at centimeter 15:

For the COLORn registers, the high order 4 bits give the hue, the low order 4 bits (with bit 0 ignored) give the luminance.

Page 116 insert at centimeter 12:

The bits in CHACT control the display of "inverse" characters as below:

Bit	Value	Result
0	off	display "inverse" character as character
0	on	display "inverse" character as blank
1	off	display "inverse" as non-inverse
1	on	display "inverse" as inverse
2	off	display all characters right-side-up
2	on	display all characters with vertical reflection

*Start off on the right foot
with an ATR8000 for your Atari.
In the long run, it makes more sense.*

You're going to expand your Atari®... So why not do it right.

Your first step, purchase of an Atari 400 or 800, was smart. Your next logical step is to buy a SWP ATR8000™ interface unit.

An ATR8000 gives you more capability for less money. You can start small, but you can build big... from an outstanding home computer to a powerful CP/M™ machine. And prices for the ATR8000 start at only \$349.95.

Yes... I'd like to know more about SWP's ATR8000 and CO-POWER-88 for my Atari 400/800 computer. Please rush me free literature.

Send to:

SWP Microcomputer Products, Inc.

SWP
MICROCOMPUTER PRODUCTS

2500 E. Randol Mill Rd
Arlington, Texas 76011
817/469-1181

We used to be Software Publishers, Inc.

ATR8000 and CO-POWER-88 are trademarks of SWP Microcomputer Products, Inc.; CP/M and CP/M-86 are trademarks of Digital Research Corporation; MSDOS is a trademark of Microsoft Corporation; Z-80 is a trademark of Zilog Corporation; Atari 400, Atari 800 and Atari 810 are trademarks of Atari, Inc.

PRICES AND SPECIFICATIONS SUBJECT TO CHANGE
WITHOUT NOTICE.

What you get first, in the amazingly adaptable ATR8000, is plug-together interfacing to all ordinary system devices:

- To floppy disk drives — The ATR8000 lets you hook up from one to four low-cost add-on drives, 5" or 8", one- or two-sided, in any mix... and go right to work with either a single- or double-density DOS. (DOS is optional.)
- To a printer — The ATR8000 parallel "Centronics-interface" is supported by a ROM driver program that you can access from Atari Basic.
- To a modem, to a serial data terminal or to any other RS-232 communicating device — The comprehensive users manual includes an Atari Basic serial printer driver.
- To Atari peripherals such as the 810 Disk Drive.

And of course the ATR8000 interfaces to the 400 or 800 computer itself.

But system versatility is just the beginning; the ATR8000 also opens the door to another world of microcomputing.

Atari-CP/M™ — A whole new world of personal computing

Quite simply, CP/M is the dominant operating system of the 8-bit micro-world. Make the ATR8000 your first system expansion unit, and you can put the CP/M world in your own little jug.

Since the ATR8000 is actually a self-contained Z-80 computer, a low-cost upgrade converts your Atari-ATR8000 system into a full-capability CP/M machine. Of course you can also start right off with a CP/M-ATR8000. In either case, you get CP/M program-development capability, plus access to an enormous base of proven application programs that just load and go. The CP/M upgrade, which includes 64 Kbytes of RAM, costs just \$249.95.

And it doesn't end there!

You can further upgrade your CP/M-ATR8000 to 16-bit microprocessing power... to CP/M-86 or MSDOS operation. Moreover, with SWP's CO-POWER-88™ upgrade, you not only retain your 8-bit processing capability, but you also can use CO-POWER-88 RAM — up to 256 Kbytes — as fast, simulated disk storage for CP/M operation.

Like the ATR8000, CO-POWER-88 comes with comprehensive documentation. Prices begin at \$749.95 with 128 Kbytes of RAM and CP/M-86 operating system.

FROM RAGS TO RICHES

A Home Financial Management Program

48K disk

by Bob Curtin

I'll never forget the look on my wife's face the day I announced I was buying a computer for the house. Her eyes narrowed to suspicious slits, her jaw firmly set, and her lips drew into a thin tight line.

"No, really, honey," I soothed, "It'll be good for the kids! I can use it for word processing! You can do biorhythms and stuff! And it'll do the family finances!"

Well, a year later we are indeed using our ATARI for home finances, and I'm not exaggerating when I declare that the impact has been phenomenal. I'd long been a sloppy money manager, prone to paying the bills in response to a late notice, or worse. We never kept records of purchases and our filing system consisted of various drawers and boxes scattered around the house.

The checking accounts were always a disaster. We were getting shell shocked from the sound of ricocheting checks, and the accompanying service charges were costing us a small fortune.

The day came when we decided to get organized; to put things right; and to use our ATARI to help us do it. We ordered a computer printout of all of our accounts from our bank, bought a filing cabinet and set up a simple filing system, and then ran into a stone wall. Finding the financial management software for our ATARI proved to be a job unto itself. Nothing fit. Either the programs were too simple, too comprehensive (I mean, who needs custom checks printed?) or much too expensive.

After months of searching, I happened across a program entitled FAMILY CASH FLOW, written by Jerry Falkenhan. This excellent program is available through the ATARI Program Exchange for under twenty-five dollars and is a steal at that price.

We immediately incorporated FAMILY CASH FLOW (FCF) into our money management system, and though it proved invaluable in recording our expenditures and income in infinite detail, and in giving us a general overview of our finances for the year, it did have some shortcomings. For instance, it didn't provide the means for setting up and maintaining a weekly budget. It also didn't keep track of

checking accounts, savings accounts, or cash on hand. I decided to write the missing parts myself, and what follows is not only the program listing and documentation, but a description of the home finance system which evolved from the use of this program and FAMILY CASH FLOW together.

Those of you out there who've not yet started using your computer for home finance management are in for a shock when you discover the difference it makes. My wife no longer glares at our ATARI with naked hatred. She doesn't love it yet, but she does treat it with a grudging respect.

The bills are now paid on time. The checking accounts are not just balanced at the end of the month; they are ALWAYS balanced. We can, in a matter of seconds, find out how much we paid for clothes last December, and even break it down to cost per individual! I can tell you how much I paid for any given item, in any given month, when the purchase was made, and the check number, all in under one minute.

As I said, there's been a phenomenal change in our home finances, and we owe it all to our ATARI.

Program Description

When I sat down to block out this budget program, there were two things I firmly fixed in my mind. First, I wanted to make the program as simple to use as possible, and also as safe and crashproof as possible. Second, although this program was written to be used in conjunction with FCF, it can also be used alone to maintain a weekly budget.

Unfortunately, I had to compromise some program speed in favor of a number of measures designed to keep the user from accidentally overwriting or wiping out data files. Data will automatically be entered and filed when accessing the budget modes and the checking account mode. Further, although you can change the week number from either budget mode, you can't change the month without returning to the main menu. This was done because the data files are named after months, and when the month changes, so does the data file name. If you were allowed to change the month, it'd be possible to

enter the data for one month, change the data file name, and then file the data from this previous month into the new file, thus destroying any data already in that file. I think the time spent waiting for automatic loading and filing of data is a small price to pay to guarantee the safety of the data itself.

All commands which alter or purge the data are two-step commands so that accidental file destructs are kept to a minimum.

Program features include up to thirty budget categories, twenty-five of which are user definable. All columns are right justified and have trailing zeros.

The checking account routine allows you to keep track of up to three checking accounts. It can also be used to keep track of savings accounts, slush funds, cash-on-hand, loan balances, or anything you'd like to keep a running tally on. When checks are written against an account, the amount is automatically deducted from the account balance, and the amount of the check and the check number is stored in memory. A running total of the outstanding checks is constantly displayed in the checking account mode, and a listing of all outstanding checks can be gotten on command. This listing includes the amount of each check and the check numbers.

A payment routine keeps track of the total

payments made in each category, and a listing of these payments can also be gotten on command.

There are several other features or functions listed on the main menu which are supportive of the features I've just mentioned. I've made every attempt to anticipate data entry which would cause errors and have provided routines prevent the program from crashing.

Getting Started

After typing in the code, the first thing that must be done is to create a data file. To do this, simply run the program. When the main menu appears, press "C" (change date). This mode allows inputs of numeric values 1 to 5 and alpha inputs A to L. The numeric values represent week numbers and the alpha inputs correspond to the months shown on the display. Press the letter corresponding to the month for which you want to create a data file. The program will return to the menu. Type "F" (file data). The program will remind you that you forgot to enter a week number and will enter the date change mode again; enter any number between 1 and 5. When the main menu reappears, a data file has been created for the month you chose.

Next, using the table of commands, run all the functions and subroutines in the program to be sure

you've done your typing correctly. If you run into problems use the program outline to locate the respective block of code, and go over it to find your mistake. Once you've gotten the program up and running, the next stop is to define your categories.

Defining Categories

This step is one which requires some thought.

First of all, make a list of all of your expenses; all of them, no matter how petty. List them in any order. Now add to the list any expenses which seasonal, such as heating fuel or motorcycle insurance. Next, delete all occasional or one-time expenses, unless you plan on budgeting for such expenses over a period of time.

Once you've got a complete list of all of your regular expenses, combine like items, such as the premiums on two separate auto insurance policies, or the payments on more than one auto loan, and then give the category a label of fourteen letters or less. Label the rest of your expenses the same way.

Next, these categories have to be divided into two separate groups, labelled "fixed expenses" and "variable expenses." Please bear in mind that the term "fixed" does not mean that the amounts in the individual categories in this group do not vary; most of them probably will. What it does mean is that

expenses in this group must be paid or the service, or commodity, or whatever will stop or be withdrawn. For example, electricity is a fixed expense. Even though the amount of the bill may vary from month to month, if the bill is not paid, the electricity will be shut off. Other examples of fixed expenses are insurance policies, rent or mortgage payments, loan payments, television cable, telephone, medical insurance, etc.

On the other hand, "variable expenses" are those which you have direct control over. You may buy the item this week or not, or you may buy more or less of it, or you may put off buying it until next week, as you see fit. You're not locked in to a set payment or rate. These payments or expenses may be varied or eliminated each week to accommodate the fixed expenses. Note that the reverse is not true. You budget your fixed expenses and then you budget your variable expenses with what's left over.

Examples of variable expenses include gasoline/oil, recreation, food and clothing.

Once you've divided your categories into the two groups, press "E" (define categories) and type the labels you've given each category into their respective groups. I suggest filling up all unused spaces in a label, and also all unused categories with dashes. It'll

make the display neater and easier to read.

When you've typed in all of your labels, repeat the file creation procedure outlined previously to store it on disk.

Now you're set to enter data.

The System

This is probably a good place to take a general overview of the budget program (BP) and how it relates to FCF. Also remember that nothing here is etched in stone, so if you feel uncomfortable with any part of the system, by all means change it to suit your needs.

In general, BP and FAMILY CASH FLOW are two sides of the same coin. FCF is used to document that which BP projects. BP allocates the funds to the different categories, and FCF documents the individual expenditures in each category. FCF also provides detailed documentation of income, and compares income to expenses on a monthly and yearly level.

The crux of the budget program is, logically, the two budget displays. The three columns (labelled "(#)", "TOT", and "VAR") represent, respectively, the weekly budget in each category, the total of all money budgeted for the month in each category, and the total variance in each category. The variance can be defined as the difference between the total money budgeted in a category, and the total payments made in a category. It's quite possible for the variance to become a minus number.

RUN the program and enter the month you created the data file for. Then press "A" (budget — fixed). The computer will remind you that you haven't entered a week number and will send you into the "change data" mode. Enter 1 for the week number. The computer will automatically load the category names which you defined earlier and print the fixed expense display on the screen.

The first column contains the amount budgeted for each category in the week enclosed in parentheses at the top of the column. To enter figures in this column, simply press the letter beside the category you want and enter the amount you want to budget. The computer will then be ready for another input.

Note that the screen display will not update itself automatically. Since the screen takes about eight seconds to print (due to the right justifying and trailing zeros subroutines) entering a lot of data would be a lengthy process if the screen reprinted itself after every input. Therefore, I made the screen update a command unto itself. Just press zero.

To illustrate how the budget display works, let's enter some data. Enter 10, 50 in category A, and update the display. Notice that 10, 50 is displayed in each column opposite category A.

Change the week number (press Q to get to the change date mode) and you'll see that column one is now empty, but column two and three have re-

mained the same. This is as it should be since you haven't entered anything for the second week yet.

Now enter 10,00 in category A again and update the display. The first column will read 10,00 and the second and third will read 20,50. The second column reflects the total of all money budgeted in a category by adding all of the weeks together. The third column (variance) is the monthly total less the total payments made in each category. The variance is a useful tool in maintaining your budget from month to month.

If you change the week number back to one, you can see that the original amount budgeted for that week is still in place, but the total and variance reflect weeks one and two together.

Let's make a payment. This is done in exactly the same way as entering figures in column one, except that the data is put in the form of a minus figure. For instance, if you wanted to make a \$50 payment in category F, you'd simply press "F" and enter -50. The computer will come right back and display what you entered and ask if it's correct. If it is, type "Y." If it isn't, type "N" (and re-enter the payment).

Make a \$20 payment in category A and update the display. Column one still contains the weekly budget, column two still holds the monthly total, but column three now reads .50, or the monthly total less the total payments.

If you press "S" you'll be rewarded with a listing of the total payments made in each category. Notice that there's a 20.00 payment listed in category A. If you were to make another payment in category A, the new payment would be added to reflect a total for the month. (Individual payments are documented in FCF, while BP is only concerned with the totals in each category.)

As you can see from the format, the BP is used to allocate your money to the different categories each week, keep a running total for the month, and tell you through the variance whether you've over- or under-budgeted for the month and by how much.

The variance is carried over into the next month so that you can adjust for it. It's important to note, however, that the carried-over variance will not affect any data entered. In other words, starting the month with a minus variance in a given category will not lessen the variance caused by new data input. On the contrary, once new data is entered in a category, any carried-over variance will be wiped from memory in that particular category.

Turning now to the checking account routine, you can see that there are the balances and totals of checks outstanding for three accounts. The commands in this mode are pretty much self-explanatory, but there are a few things that you should know.

First, each account will handle a total of forty-five outstanding checks at any given time. This is sufficient for most people, but if you find yourself

writing more than forty-five checks a month in a particular checking account, you can borrow the check handling capacity of one of the unused accounts and handle the balance manually through the deposit and withdrawal commands.

One of the most useful parts of this program is the outstanding checks listing. It's a simple matter to balance your checkbook each month by deleting the outstanding checks each month when the bank returns them.

Words of Caution

With the three columns and the category labels, the display is a bit crowded. I must warn you that the program will crash if any value greater than 9999.99 runs through the right justification subroutine, and printed to the screen. It was a matter of room more than anything else, and I reasoned that anyone with a budget of \$10,000 a month would have absolutely no reason to use this program anyway.

When you're ready to create a file for a new month, simply load the data from the previous month by pressing "G" (get data). When the program returns to the menu, change the month to the new month, press "H" (clear data) and when the menu returns, press "F" (file data). The clear data command clears all of the variables except those containing the checking accounts, category definitions, and variances. This data will be retained and carried into the new month. REMEMBER TO CHANGE THE MONTH BEFORE FILING THE PURGED FILE OR YOU'LL DESTROY THE CONTENTS OF THE OLD FILE. This is worth repeating. To create a data file for a new month, you:

1. Press "C" (change date) and set the month to the most recent file.
2. When you return to the menu, press "G" (get data) and load the contents of the most recent file. (This gives you the checking account balances, outstanding check list, and category labels.)
3. When you return to the menu, press "C" again and change the month to what you want to create the new file for. THIS IS VERY IMPORTANT!
4. When you return to the menu, press "H" (clear data.)
5. When you return to the menu, press "F" (file data.) When you return to the menu, a new data file will have been created containing the checking account balances, outstanding check lists, category names, and variances.

Though it's really not necessary to save old files, I suggest keeping six months of old files at any given time. Then, when a new file is created, delete the file which is then seven months old. Even though all of your expenditures are recorded in infinite detail in FCF, reviewing the monthly variances from time to time will tell whether you're chronically over or under budgeting in a certain category.

Always be sure to keep back-up copies of your data files.

Hints, Suggestions, and Putting It All Together

This is sort of a potpourri of informational tidbits which might help you to keep your budget running smoothly after you've gotten it set up. Some of it may sound patently obvious, even to the most casual observer, but I include it for those of you out there who are anywhere near as inept with money as I, if that's possible.

First of all, before you can effectively plan ahead, you have to know where you **are**. Set up some sort of filing system to keep all of your bills, receipts, warranties, insurance policies, legal documents, medical records, recent bank statements, deposit slips, business letters, tax forms and records, school records, and so on, in a single, easily accessible place. Keep old bills only until you've actually been credited for the last payment on a new bill; then throw the old bill away. Do your filing every day; don't let it build up to a job that takes more than minutes at a time.

Records are extremely important in the scheme of financial affairs, so pay as many bills as possible with checks. If you make accurate and copious notations on each check as to exactly what the money is being spent for, you'll have little problems from your end of a lawsuit or an IRS audit. Find yourself a bank that gives out free checking (or even better, pays interest on your checking account) and then take full advantage of it.

Whenever you send out a check, be sure to make a notation in your checkbook of the **mailing date**, not just the date the check was written.

As I've mentioned previously, the FAMILY CASH FLOW program is used in this financial management system mainly to document expenditures. It's very good at this, allowing up to 125 individual entries per month (250 individual entries if you have two disk drives) in thirteen categories. Each entry documents the date, the amount of the payment, and allows a description of the payment up to 15 characters long. This description is useful for a number of things, such as recording the check numbers along with the company the check was sent to. For instance, ELECTRIC (623). You can record where you've made cash purchases by including the name or initials of the store in the description. An example of this is: SHOES(KINNEY).

If you have credit cards, you can indicate the purchases made with them much the same way, i.e. DISKS(VISA). Incidentally, you should keep files for each credit card in your filing system to hold the receipts and monthly statements. When you make your monthly payments, you'll have a someplace to file the check number and date, other than your computer. It always pays to keep a hard copy.

Never mail a check that isn't covered by funds in your checking account. You can make the check out

ahead of time. You can enter it into your computer. You can even put the stamp on the envelope. But don't mail it until the money's actually in the account. Ol' Murphy just lays in wait for folks who make a habit of that, and it'll end up costing you in service charges.

Make savings one of your fixed expense categories. Pay yourself first, then pay your bills. I know you've heard it before, but pick a percentage, no matter how small, and skim that right off the top. Stick it into a savings account and forget it. Once you get into that habit, you can increase the percentage, and watch your dough grow!

Use the variances; they're great for tagging unwanted trends. If you notice categories which you have to constantly increase week after week, then go to the FAMILY CASH FLOW program and review the expenditures. For instance, if you see a trend toward an increase in gasoline usage, you may need a tune-up on the bomb.

FCF, if used properly, can show you some surprising things about your buying habits. Be absolutely ruthless in documenting expenditures, even if you're not too thrilled about being reminded of them. I'm definitely an impulse buyer, but after getting into the habit of telling my ATARI what I'd spent my money on that day, and then being ashamed of myself when the figures glared back at me when looking at it the next day, I tend to think more now before reaching for my wallet. Be honest. Don't bury embarrassing purchases. As a matter of fact, if you have any money-gulping bad habits like smoking or drinking, being reminded of the cold, hard cash going down the drain day after day can be an added incentive to moderate or abstain.

Now down to the nitty gritty. Just how do you use these numbers?

Well, first of all, you have to have some method of defining the weeks in a month. Most months on the calendar have at least one week which overlaps from one month to the next, that is, part of the week will begin in one month and then end in another month. This isn't a problem with a monthly budget, but with a weekly budget, unless you can automatically signify which month a particular week belongs in, the budget could get confusing, to say the least. The method for doing this has to be simple and consistent from month to month.

One method is to pick a day of the week to trigger the start of a new week. It really doesn't matter which day you choose, as long as it remains the same every week and month to month. The day you choose will determine the number of weeks in a month (either four or five) and will trigger the start of a new week. For instance, suppose you chose Wednesday as your "trigger" day. In August of 1983 there are five Wednesdays (the 3rd, 10th, 17th, 24th, and 31st). Therefore, there are five weeks in August. The first day of the month is Wednesday, August 3rd, and the

last day of the month is Tuesday, September 6th. Note that August 1st and 2nd were included in the last week of July.

Of course, you may devise any method you want. Just be sure your method assigns each and every week of the year to a specific month and to no other.

That done, the next thing to do is to go back to your filing system.

Remember that the reason for setting up a budget in the first place is to separate your income into little piles according to the categories which you defined earlier. It wouldn't do to separate the money in name only, so the thing to do now is to provide a place to store the budgeted cash until it's needed. Get yourself some medium-sized coin envelopes and label one envelope for each category in the Budget Program which you pay in cash. Those categories which you pay by check obviously don't need envelopes because the cash is deposited in your checking account(s). Next, label file folders to match the envelopes. Some of the envelopes can be doubled up in file folders if they're similar. Just be sure to mark the folder with both labels. Now, when you budget a certain amount for a category, physically place the cash into the appropriate envelope.

Let's say you budgeted \$65.00 in a given week for food, but spent only \$56.50 at the market. The last column in your budget Program will show a variance of \$8.50, and you should indeed put the remaining \$8.50 back into the envelope to keep the computer honest. When it becomes time to budget for the next week, you may use the extra cash to augment your food budget. For instance, if you decided to stick to the \$65.00 figure for food the next week, you need actually only put \$56.50 down as the budgeted figure for that week, but the variance will go to \$65.00 and will reflect what's actually the cash total in the envelope.

A word of advice. It's not really a good idea to over-budget on a consistent basis and built up considerable amounts in your envelopes. It's a far better idea to take that extra cash and stuff it into a savings account or an IRA and earn interest on it. Try to budget exactly what you need and no more. Put \$30 to \$50 into your MISCELLANEOUS envelope to act as a buffer against minus variances.

Speaking of minus variances, be sure to mark on the outside of the MISCELLANEOUS envelope the category which "borrowed" the cash, and of course, the amount borrowed. Make the same notation on the category envelope. The next week, all minus variances should be paid back to MISCELLANEOUS file before any money is budgeted. For the sake of clarity, let's assume that in our FOOD category, we had a -8.50 variance left over from last week. If we wanted to maintain our \$65.00 level, we'd have to budget \$73.50, \$8.50 would be put into the MISCELLANEOUS file, and \$65.00 would be put into the FOOD file. Note that by entering

We have over
1000 Educational Programs
for use on your
Atari 400/800 Computers!

*You and your family will enjoy
learning in your home when you*

Stop Playing with Your Atari

All along you've heard there isn't much of a selection of low cost microcomputer courseware. Well, do you want to learn Physics, Psychology, or Philosophy? Accounting or Auto Mechanics? Sociology, Supervision or Statistics? Economics or Electronics? How about English as a Second Language? Would you like to teach your children Math or Reading? If you do, then we have the educational programs for you—and at affordable prices.

It's true there aren't many companies that offer full-length courses in subjects other than reading and arithmetic, and what is offered seems to be drills, tests, games, or simulations. What you really want is a course that covers the subject with, say, 16 full-length lessons called tutorial programs, where you interact with an expert programmer backed by a staff of experts. That's exactly what we have.

ASK THESE QUESTIONS

Why haven't you heard of us before? We're a public company that's been trading over the counter for 16 years. We've been developing interactive learning systems since 1957. We sell hardware and software for interactive film, slide, video and computer learning to the educational field, vo-techs, industries, military, and several state and federal agencies. Our programs are used in all 50 states and even in some foreign countries! In 1975, we started to convert to the Talk & Teach Computer-Assisted Instruction (CAI) System, licensed Atari to use it in 1977, and in 1981 licensed Radio Shack to use our Talk/Tutor System. So, why haven't you heard of us? Frankly, we've kept a low profile. Until now.

Is there something wrong with our software? Well, we don't ask you to enter your name so we can drop it into some later text. We don't ask you to type in your answer and refuse to accept it if it's not spelled just right. And, we don't branch around a lot when you make an error. Our programs simply let you know if you're wrong by proceeding only when you select the right multiple-choice answer.

This proven learning-by-positive-reinforcement method lets you proceed quickly and smoothly through the programs, without a lot of cute tricks. But, if you're a devoted computerist or game freak you may be disappointed at the lack of motion in most of the pictures, or our special visual effects. We have some dandies, like the mushroom cloud that rises over Hiroshima in our History series, but your learning is not distracted by needless special effects.

OVER 1000 PROGRAMS

We have 64 courses of 16 half-hour programs: 1024 programs! All are easy-reading,

upper-and-lower-case. All are in Atari color. All are illustrated by frequent graphics, composed of special and regular characters. And, best of all, every frame of every program is accompanied by high-quality, full-time audio narration by professional voice talent. David Stanton, James Mathers, Pam Barrymore. Recorded and played back, not synthesized or digitized!

— If your child is having trouble with Reading or Math, or if he or she is exceptional, and could benefit from professionally programmed lessons or courses, then you need our educational programs for your Atari 400 or 800 to help your child.

— If you want to build your math skills, we have programs on Numbers and their meanings, Addition, Subtraction, Multiplication, Division, Fractions, Decimals, Percents, Angles, Graphs, Word Problems, Algebra, Statistics. There are ten series in all, 160 math programs. Again, all with color, pictures, and a friendly tutor's voice—all the time.

— If your verbal skills need polishing, try our Talk & Teach programs on the alphabet, spelling skills, and every level of vocabulary; Sight Words or Learn by Phonics; develop Reading Comprehension skills from stories and articles. There's even a series on the Great Classics.

— For self-development, try a 16-program course in Economics or Psychology. Or Supervision, Sociology, Counseling (Personal, School, or Employee), Writing, Business, Philosophy, Government, World History, U.S. History, or Accounting.

— For vocational skills, study our 16-program courses in Electronics, Fluid Power, Auto Mechanics, Shop, Carpentry, Construction, Meat Processing, Military Skills (64 programs), and there are many more.

YOU HAVE WHAT IT TAKES

You'll need your Atari 400 or 800, and the Atari Cassette recorder. And to present the Talk & Teach programs you need the Educational System Master cartridge: it's \$25 from us, if you don't have one.

We say these courses, which are recorded one program per side of C20 to C30 (half hour) cassettes, are the equivalent of a chapter, or perhaps an hours lecture. We've been told that by studying our Economics or Psychology course, a student could pass a secondary or college test for credit. Many who have such credits never learned all that's in these courses. And while some of our courses have 1980 copyrights, most are 1981 and 1982. In U.S. History, for example, you'll learn about America's foreign policy during the

Falklands crisis as well as that in the Mideast in 1982. And we're putting this information at your fingertips.

Not sure whether you agree more with Rationalists or Existentialists? Do you commit logical fallacies? Try our Philosophy course. If you're not sure about neurosis or psychosis, classical or instrumental conditioning, then you need our Psychology course. Just how independent is the Federal Reserve? Get Economics, Program 12. Confused about the changes in traditional roles of political parties? It's Government 5. And let our tutor tell you patiently and clearly about measures of dispersion and central tendency. Our Statistics goes through F tests. We even have 16 full-length audio-computer programs with Spanish words and phrases.

Remember, these are all for your Atari! Yes, we've done programs for TRS80 Model I, III, Color, for the Apple and T. I. But that's another story.

Would you like to do something more than play games on your Atari? Tired of squeaks and robotics and want to hear a human voice? Do you want to further your education or help your children along in theirs? Now you can. For just **\$9.90**, we'll send you one cassette with 2 programs from the course of your choice, 100% guaranteed to work in your Atari, and you can try us out. Better yet, get one full course of 16 programs on 8 cassettes for only **\$59.90**. For full documentation, 32 pre-post tests, fancy binder, 8 cassettes with 16 programs of the course you want, send **\$79.00**. That's less than books and tuition for most college classes. And we offer a 10 day, 100% exchange allowance. Does your alma mater? Send us your check, or call us at (405) 288-2301 with your Visa/Master Card number. We'll send your educational software pre-paid. Please allow 15 days delivery. Or see your Atari dealer. He may have some of our courses in stock. You've got nothing to lose but your games!

tmq
SOFTWARE, INC.

82 Fox Hill Drive, Buffalo Grove, IL 60090

FILE-FAX is the easiest-to-learn, simplest-to-use DBMS available today! Designed as a "filing system" for the businessman or hobbyist, FILE-FAX quickly accesses records, retrieving information at exceptionally high speeds.

FILE-FAX can be used to keep track of a wealth of information—about people, places, dates, events. It has an 8-level sort, wide ranging search capability, and a powerful report generator. Use it for inventory control, customer files, mailing lists, purchase records, and more—you are limited only by your own imagination.

FILE-FAX will run on your APPLE II or II+, Atari 800, IBM-PC, NEC PC-8001, Commodore 64, Osborne, and Victor 9000. Write for full details. Please specify the computer you are working with.

by Brian Moriarty

The home computer market is obsessed with graphics. Flip through any computer magazine and you'll find pages and pages of game advertisements, each promising high-res action graphics in at least four more colors than the hardware is capable of displaying. Game programmers spend countless hours squeezing the last pixel out of their playfields — and any dealer will tell you that a flashy title screen is worth more than a good game concept.

In this world where even the best computer games come and go in the space of a single month, the prose adventures of Infocom stand apart. Their unadorned text boasts only two colors (foreground and background); there are no illustrations, no sound effects to jazz up the action. Yet the Interlogic series is comfortably lodged in the top-25 list of every major software distributor.

What is Infocom's secret? Why does a 4-year-old text game like **Zork** continue to flourish when even the venerable Scott Adams Adventure Series (now "enhanced" with flickering graphics) fails to hold the interest of computer enthusiasts?

The answer, I think, has less to do with Infocom's famous packaging than with the fundamental quality of their products. When I play an Interlogic adventure, I don't get the feeling that the thing was coded according to a formula, shrink-wrapped and shoved out the door in a couple of weeks. There's a sense of completeness and pride in engineering, as if the programmer had a genuine emotional investment in the game. **Suspended**, the latest offering in the Interlogic Science Fiction Series, conveys this sense of personal authorship more than any other computer adventure I have played.

An intriguing scenario

Suspended was created by Michael Berlyn, a programmer best known as the author of the best-selling Apple adventures **Oo-Topos** and **Cyborg**. Just as this issue went to press, I received the new ATARI conversion of **Cyborg** from Berlyn's former company, Sentient Software. Look for a report on ATARI **Cyborg** in a later issue, and let's hope we'll see **Oo-Topos** in the near future.

Suspended is similar to **Cyborg** in that it puts the player in control of an imaginary cybernetic system. Your frozen brain is hooked into a network of "filtering computers" which are directly responsible for the care and feeding of an entire planet. This delicately-balanced network is maintained by a team of six robots which respond to your commands. The filtering computers allow you to address the robots individually, or in any combination.

Each robot is endowed with special hardware capabilities and a unique personality. Your job is to coordinate the action of the robots so that the planet you are babysitting remains comfortable and happy. The penalty for failure? Chaos, massive casualties and disconnection!

Like the other adventures in Infocom's Interlogic series, **Suspended** incorporates a sophisticated parser that understands complex English sentences, with a vocabulary of over 600 words. Phrases like "Put the rough object into the access panel then close the access panel" are perfectly legal; multiple commands may be entered on a single line by ending each phrase with a period. The program also accepts a number of useful abbreviations, and will support

New Release WHIZ KID™

ECPC Cartridge™ for use with Atari®, Commodore and Texas Instruments computers.

An exciting educational game that combines fast ice hockey action and learning. Form words or mathematical equations by combining the ice cubes. But watch out for the goal keepers—they're out to stop you! Five different levels of difficulty provide hours of educational fun.

Available now for Atari 400, 800 and 1200 computers.

Romox Inc.
 501 Vandel Way
 Campbell, CA 95008
 (408) 374-7200

the saving and loading of up to five separate game positions. You can choose between five levels of play difficulty (including an inconceivably tough "IMPOSSIBLE" game), or custom-design your own game configurations. These features should keep your copy of **Suspended** far away from the shelf where your "solved" adventures are gathering dust.

Suspended comes with an attractive full-color game board and a vinyl token for each robot. These allow you to keep track of where the robots are located in the planet's underground maintenance complex. The superb owner's manual provides an amusing historical background and detailed information about the robots' abilities and limitations. And let's not overlook that incredible packaging — an eerie molded mask with eyes that follow you around the room, saying "I really am worth fifty dollars!"

Clever characterizations

Berlyn's most impressive achievement in **Suspended** is his characterization of the six robots. Each responds to your commands with a rhetorical style that is fancifully suited to its function.

"Iris," the only robot equipped with visual receptors, is a wise-mouthed old woman who replies to your commands with "Okay, good looking," and interrupts the game with complaints when she needs a repair job. "Waldo" (an all-purpose worker with multiple grasping extensions) is an affable fellow with a distinctly blue-collar outlook. "Whiz" is the bookworm of the team; he communicates in a clipped, matter-of-fact manner and is only happy when plugged into an information pedestal. "Poet" reminds me of an ex-60s burnout. His replies are embellished with hip slang, horrible rhymes and obscure literary quotes.

A few hours with these electronic personalities will make them your friends. This is the kind of compliment you would normally extend to a good book or movie, not to a computer game. But the scenario and implementation of **Suspended** are so professionally crafted, that the product actually manages to transcend the typical text adventure (often nothing more than a puzzle that understands English), offering a level of involvement which can only be compared to the experience of a fine novel. That this feat is accomplished without elaborate graphics proves Infocom's contention that the mind is more imaginative than the eye.

Suspended is not without its petty annoyances. Since the room and object descriptions are stored on a disk as text files, you have to be patient while the slow 810 disk drive beeps and clacks, searching for just the right sentences. Typing commands can get pretty tiresome after several hours of play, especially if you make your living by typing all day like I do. But these inconveniences are caused by the hardware, not the software; future home computers with megabytes of RAM and voice recognition will make such limitations a thing of the past. Until then, let's enjoy the pioneering efforts of authors like Michael Berlyn and companies like Infocom, whose products are among the finest examples of a new and entertaining means of self-expression which can now be regarded as "literature" without apology. □

New Release SEA CHASE™

ECPC Cartridge™ for use with Atari®, Commodore and Texas Instruments computers.

Submerge yourself in this fast action game of submarine survival and treasure hunting. You as commander of your very own yellow submarine must locate and capture the ten missing treasures while avoiding the deadly sea mines. A keen sense of logic and a love for keeping your head above water a must!

Available now for Atari 400, 800 and 1200 computers.

**Design the best new M*A*S*H™
video game, and you'll get
something money can't buy.**

Fame.

That's right. F-A-M-E.

Because if the game you design is good enough, we'll make it and put your name on every one we sell.

And remember, you don't have to be a computer programmer to come up with a great game. You just have to have a great imagination, and give us a short description of your idea.

IF FAME ISN'T ENOUGH, HOW ABOUT A FORTUNE?

\$25,000 to be exact. That's how much the game contract will bring you. Guaranteed. What's more, we're giving away a whole list of prizes for the other great game ideas we get.

- Four First Prize AMC Jeeps®
- 400 Second Prize Texas Instruments 99/4A™ Home Computers.
- 4000 free Fox Video Games.

EVERYBODY WINS.

Because the new M*A*S*H game comes packaged with a smashing M*A*S*H T-shirt.

Absolutely free.

HOW DO YOU GET STARTED?

Just buy the original M*A*S*H game. The contest rules and entry blanks are in every package.

And if you win, you might say the rewards are monumental.

Games of the Century

**THE M*A*S*H™ CONTEST.
IT'S A SMASH.**

The programs from book No. 164 on disk (book included).
Order-No. 7100 \$29.00
Programs from Book No. 162 on disk (book included).
Order-No. 7221 \$29.95
GUNFIGHT
This game needs two joysticks. Animation + sound. Comes on a bootable cassette.
Order-No. 7207 \$19.95

Hardware-ADD-ONS for ATARI
EPROM BOARD (Cartridge) Holds two 4k EPROMs (2532). EPROMs not included.
#7043 \$29.95
EPROM BOARD KIT
Same as above but bare board only with description.
Order-No. 7224 \$14.95
Printer Interface
This construction article comes with printed circuit board + software. You can use the EPSON printer without the ATARI printer interface. (Gameport 3 and 4).
Order-No. 7211 \$19.95
RS-232 Interface for your ATARI 400/800 Software + connector + constr. article.
Order-No. 8291 \$19.95
EPROM BURNER for ATARI 400/800 Works with gameport. No additional power supply. Comes complete, assembled with software (2716, 2732, 2532).
Order-No. 7042 \$179.00
EPROM BURNER for ATARI 400/800 Kit Printed circuit board incl. software and extensive construction article.
Order-No. 7292 \$49.00

ATMAS
Macro-Assembler for ATARI 800/48K. One of the most powerful editor/assemblers on the market. Versatile editor with scrolling. Up to 17k of source-code. Very fast, translates 5k source-code in about 5 seconds. Source code can be saved on disk or cassette. (Includes ATMONA-1).
Order-No. 7089 disk version \$89.00
Order-No. 7999 cartridge version \$129.00
ATAS
Same as ATMAS but without macro-capability. Cassette-based.
Order-No. 7098 32K RAM \$49.95
Order-No. 7998 48K RAM \$49.95

ATMONA-2
This is a tracer (debugger) that lets you explore the ATARI RAM/ROM area. You can stop at pre-selected address, opcode, or operand. Also very valuable in understanding the microprocessor. Includes ATMONA-1.
Order-No. 7049 cassette version \$49.95
Order-No. 7050 disk version \$54.00
ATMONA-1
A powerful machine language monitor. Disassemble, dump (hex and ASCII), change memory location, block transfer, fill memory block, save and load machine language programs, start programs. Printer option via three different interfaces.
Order-No. 7022 cassette version \$19.95
Order-No. 7023 disk version \$24.95
Order-No. 7024 cartridge version \$59.00

Inventory
Control — Completely menu driven.
Order-No. 7214 disk version \$19.95
Order-No. 7215 disk version \$24.95
This program makes writing invoices easy.
Order-No. 7201 cassette version \$29.95
Order-No. 7200 disk version \$39.95
ATAMENO — This is the date-book you always wanted. Makes effective time planning easy!
Order-No. 7310 disk only \$29.95

Mail List — Mailing driven program allows the small business man to keep track of vendors and customers. You can search for a name or address of a certain town or for an address with a certain note. 50 addresses are put into one file.
Order-No. 7212 cassette version \$19.95
Order-No. 7213 disk version \$24.95

FORTH
from Elcomp Publishing, Inc. is an extended Fig-Forth-version. Editor and I/O package included. Utility package includes decompiler, sector copy, Hex-dump (ASCII), ATARI Filehandling, total graphic and sound, joystick program and player missile. Extremely powerful!
Order-No. 7055 disk \$39.95
Floating point package with trigonometric functions (0-360°).
Order-No. 7230 disk \$29.95
Learn-FORTH from Elcomp Publishing, Inc.
A subset of Fig-Forth for the beginner. On disk (32K RAM) or on cassette (16K RAM).
Order-No. 7053 \$19.95

ATEXT-1
This wordprocessor is an excellent buy for your money. It features screen oriented editing, scrolling, string search (even nested), left and right margin justification. Over 30 commands. Text can be saved on disk or cassette.
Order-No. 7210 cassette version \$29.95
Order-No. 7216 disk version \$34.95
Order-No. 7217 cartridge version \$69.00
A version for the BIT/360 col. card is available.
ATCASH-1 — Cash register for ATARI
Order-No. 7307 disk only \$49.95

E.S.I. Takes the 'Boob' out of the Tube.

Your children will be entertained for hours playing with Proto in these three creative learning adventures.
(For Kids ages 4 to 10)

ADVENTURES OF PROTO The first in our series of adventure learning games. Children will enjoy teaching Proto to color pictures they create, inventing new songs and catching Proto's favorite snack, Mars-Mallows. The games even allow you to save the songs and pictures your little one and Proto create. The manual includes a story book and game pages. 16K Tape or 24K Disk. BASIC cartridge and joystick required. All three adventures for \$24.95

PROTO'S FAVORITE GAMES Ever since Proto came to earth he has been busy learning new games with his friends. You and your friends will have fun connecting the dots to see who can make the most squares. In Fifteen, see how many moves it will take you to unscramble the numbers from 1 to 15 (in the right order of course). Scorefour is Proto's new game of strategy similar to Tic-Tac-Toe but a lot trickier. One or two players can bowl in Proto's bowling alley where you try to score a perfect game of 300. 16K Tape / 32K Disk. BASIC cartridge and joystick required. Four fun filled learning games for \$24.95.

PROTO'S FUN DAY It's Saturday and Proto wants to know what Earth kids do when they're not at school. Well, with the help of the sun, your child and Proto can grow a beautiful garden. In 'Kidstuff' they can try their luck at matching shapes. Or they can help Proto assemble brand new robots in Professor Von Chip's laboratory. 16K Tape / 32K Disk, joystick and BASIC cartridge are required. All three games for \$24.95

For ALL Ages:

MUSIC MAJOR People of all ages can get a head start on music class with Educational Software's Music Major program. Presented in a lighthearted manner, this program uses comprehensive lessons to teach the fundamentals of music. Covering such topics as note recognition, key signatures and note counting, it is designed for use by both individual students and music classes. This program includes a thoroughly illustrated manual and offers a Quiz Master utility that allows teachers to create their own multiple choice tests. A sample quiz on Beethoven is included. 32K Tape or Disk. \$39.95.

MULTICOLOR SCREEN GENERATOR

16K cassette 24K disk

by Richard J. Kalagher

This program will allow you to develop a custom screen in Graphics Mode 0. Each of the 24 lines of text can be a different color of your own choosing from ATARI's 128 available colors. After you develop your custom screen you can save it on disk or cassette and use it in any of your own programs.

I originally developed this program for a friend who wanted to make color slides for teaching. He used this program to set up a multicolor screen. He then wrote the text on the custom screen with a BASIC program and made slides by photographing the TV screen. But that is just one of the uses for this program. You can highlight titles in a different color, create custom text windows, make text disappear when it scrolls through an area of the screen, or create colorful games in Graphics 0. You can even use it to demonstrate for your friends how an ATARI can easily put 24 colors on the screen at once.

Using The Program

Before describing how and why the program works I will discuss how to use it. Type in the BASIC program from Listing 1, save an extra copy, and RUN it. After a brief initialization, the input screen will appear. The left side of the screen should have "Line No. X" written on each line where X is the line number (from 0 to 23). This is just an aid to help you identify the line you want to change. On the right side of the screen, the color values are given, along with a reminder that luminance values vary from 0 (black) to 14 (white) in steps of two. At this point, the cursor is resting halfway down the left side of the screen waiting for you to enter a line number. Enter a number between 0 and 23. If you enter an invalid number you will be prompted again to enter a line number.

Next, you will be prompted to enter a background color. Select a number from 0 to 15 from the list at

the top of the screen. Then comes the background luminance. Zero will give you a very dark color while 14 will be a very bright color. If you enter an odd number it will automatically be rounded to the next lower even number. For example, a nine or an eight will both produce the same luminance. Finally, you will be asked for a character luminance. In Graphics mode 0 the character is the same color as the background but a different luminance. A low numerical value gives a dark character while a high value gives a light character.

When you press RETURN after entering the value for character luminance, the line you selected will change color. If you don't like the effect, enter the same line number and make the changes you want. If you want the same value for a parameter (except line number) that you previously entered, just hit RETURN at the prompt. This feature is very useful when you want to change a block of several lines to the same color and luminance. Just enter the new line number each time and hit RETURN three times until the new line changes color.

When the screen is just as you want it, enter a negative line number to save the custom screen. You will be told not to touch any keys while the program writes some data statements on the screen. The program is actually modifying itself to incorporate the new screen colors. Be sure you have made a copy of the program before this step.

You will be asked if you want to save the screen. If you say YES, just answer the questions and a subroutine will be saved on disk or cassette. You can merge this subroutine with any of your own programs by using the ENTER command. This subroutine will occupy lines 30000 to 30260 in your program. Just put a statement GOSUB 30000 in your program and you will get the custom screen.

This screen will stay until you press System Reset or execute a GRAPHICS statement in your program.

Theory Of Operation

The program works by using Display List Interrupts. The assembly language program in Listing 2 contains the interrupt code. Before each new Graphics Mode 0 line is drawn, an interrupt is generated and the machine code is executed. The code looks at the value in location COUNT to check which line is being drawn. The color for that line is taken from the table starting at COLTAB and the luminance is taken from the table starting at LUMTAB. These values are then put directly into the color registers. During the vertical blank interval, the value in COUNT is reset to 1 and the process repeats itself for the next screen.

The BASIC program in Listing 1 contains this machine language program in the DATA statements in lines 30170 to 30260. The statements in lines 30000 to 30160 POKE this code into the upper half of page 6, set the interrupt bits in the display list, and enable the interrupt code. Remember that this subroutine must be called after any GRAPHICS 0 statement in your program, although if you call the routine a second time you could call it at line 30050 since the machine language program will already be in memory. Also, line 30001 can be removed if you do not want to clear the screen.

The first part of the BASIC program is fairly straightforward: it basically sets up the input screen and after accepting the color values, POKES them into the color and luminance tables that the display list interrupt code uses. TRAP statements are used to skip around the input statements if you type in an illegal value (e.g. RETURN). The variable that was input will then retain the same value it had previously.

The code in lines 31000 to 31330 is executed when a negative line number is input. This code first modifies the DATA statements to save the custom screen. It then prompts you to save the custom screen to disk or cassette. Notice that you can enter a file name that starts with "D:" or you can enter just the name and the "D:" will be added to the beginning of the file name. (As an exercise, try modifying this section of the code to recognize file names that start with "D2:").

Other Considerations

There are several things to watch out for when using this program. First, you may notice that when you press a key, an extra scan line may momentarily appear between bands of different color. This is due to the fact that the ATARI keyclick routine uses the WSYNC register to time the keyclick. There is no easy way around this problem. You can trade off this problem for a slight constant jitter at the far right of the screen at the last line before a color change. To do this, try changing the last number in line 30170 and

the first two numbers in line 30180 to 234 (i.e. the 141, 10, and 212 should all be changed to 234's).

Another problem occurs during the I/O to the disk, cassette or printer. During I/O the line counter is not updated. The screen will roll and show random blinking colors although it will return to normal after the I/O operation is complete. If this is bothersome to you, POKE location 54286 with 64 before the I/O and then POKE in a 192 after the I/O is complete. This will turn off the interrupts so that the whole screen will become the same as Line 0.

While not a problem, be aware that if a line has the same luminance for background and character you will not be able to see the text on that line. You can use this feature, however, to make text seem to disappear on a certain part of the screen.

Conclusion

I hope you find this program and the techniques used in it useful. Don't be afraid to experiment, either. For example, if you study the code carefully you should be able to do things like changing colors of lines at will during the running of your own programs. □

THE GREATEST ATARI® GAME OF ALL TIME.

**Object: Capture more programs than
from any other source.**
Score: The best prices for programs win.

Actually, every member of CompuClub is a winner, because no one pays lower prices for Atari® programs than our members.

And no other source offers as many programs, with a descriptive catalog covering every piece of software we offer!

CompuClub has hundreds of Atari® programs: games, education and business. It's an astonishing selection, but just as incredible are our prices and our catalog.

**Prices always at least
25% below retail**

Fact is, usually our prices on selected programs are even lower than that. And we're always running sales with savings of at least 50% from the list price on some of your favorite programs.

And there are several ways to pay: MasterCard, Visa, or the ever popular check or money order.

**Annotated catalog,
updated every 45 days**

We don't like to knock the competition, even by implication, but there are definite advantages to a CompuClub membership. One of the best of them is our catalog, which not only offers an unbelievable number of programs, but includes a description of each and every one of them.

In fact, the catalog is so big and filled with so much information that we print a separate price list. And we keep adding so many programs that we have to update the catalog nine times a year during the course of your membership.

Think of it! No more wondering what's behind the fancy label, no more shooting in the dark or depending on the word of a clerk who may not be familiar with the program you're interested in.

Exclusivity for Atari® owners

We're not trying to be all things to all people. We are definitely the best thing since the floppy disk for Atari® owners, and only Atari® owners. CompuClub is very exclusive.

Our catalog is thick with hundreds of Atari® programs, and only Atari® programs. No more fumbling your way through thickets of strange symbols and codes for the different computers everybody else's catalogs try to cover.

The rules

The rules are simple. To play the CompuClub "game," you've got to be a

member. Anyone can join, as long as they fork over a mere five bucks, and agree to buy three programs during the year of membership. Order and buy your programs at any time during the year, but we're sure with our selection and prices that you'll want to get going right away.

Five dollars buys you a one-year membership, exclusive Atari® program offerings, a fully annotated catalog with 9 updates during the year, a current price list (and any necessary updates), a subscription to our newsletter, and discounted prices at all times, including announcements of our periodic sales, which feature savings of 50% off and more.

You can join by filling out the coupon below, or get an instant membership by calling our toll-free number and giving us your MasterCard or Visa identifying number. We'll forward your registration and sales order materials, your catalog and price list, so you can begin ordering right away.

That's all there is to it.

If you think you play a good game, you've got to join CompuClub. It's easy to play, and it saves you money.

We think it's the best Atari® game going, because with us, everybody wins.

CompuClub

Where Atari owners belong.

YES,

CompuClub, PO Box 652, Natick MA 01760

I want to play the greatest Atari® game of all. Please enroll me in CompuClub for one year, and rush my registration material, catalog and price list to me. I agree to buy any three programs during the course of my year of membership. I have enclosed my payment of \$5, or authorization to bill my charge card account.

Please make your check payable to CompuClub

Payment enclosed ☐ check ☐ money order.

Bill my ☐ MasterCard ☐ Visa ID # _____

POKERSAM

by Jerry White

For the Atari 400, 800, and 1200 XL
 Requires 32K RAM

• Disk or cassette
 • Suggested retail: **\$24.95**

To order direct from DON'T ASK, send a check or money order, or call to order C.O.D. Add \$2.00 shipping and handling. California residents add 6% sales tax (6.5% if you reside in L.A. County). **Please specify disk or cassette version.**

Registered owners of S.A.M. for the Atari: you can get a special low-priced version of **POKERSAM**. Please write to DON'T ASK for information, and be sure to indicate your S.A.M. serial number.

THIS POKER PLAYER HAS SOMETHING UP HIS SLEEVE . . . HE TALKS!

The makers of S.A.M., the Software Automatic Mouth, now bring you a revolutionary talking game: **POKERSAM**. He narrates every hand aloud, naming the upturned cards, announcing the bets, and wisecracking whenever he gets the chance. Like a lot of poker players, he's sometimes full of bluster and he isn't always a good sport. But he's always a real character with a gift for gab.

Your Atari **needs no separate speech synthesizer** to produce **POKERSAM's** speech. It's all done with the S.A.M. speech system. As you may know, S.A.M. is available separately as an unlimited-vocabulary speech synthesizer that you can access in your own programs. **POKERSAM** is not a tool for creating your own computer speech, but it contains a small module of the S.A.M. system. This means it can make any Atari computer speak, without additional hardware or software!

Dealer inquiries welcome

THE A.N.A.L.O.G. GUIDE TO ATARI COMPUTER PUBLICATIONS

by Cris Popenoe and Lee Pappas

When I started this article, I had no conception as to how many books and guides actually existed for the ATARI computer owner. This listing basically covers the books, with a brief description of each. In some cases opinions are given, however this listing is intended to inform our readers of detailed publications covering specific applications.

While we have tried to make this listing as complete as possible, no doubt there are a few omissions. If any readers know of additional publications, feel free to drop me a line. —LP

LINDA A. SCHEIBER, ADVANCED PROGRAMMING TECHNIQUES FOR YOUR ATARI, including GRAPHICS and VOICE PROGRAMS, illustrated, 224pp. (0830615458), 13.95

Covers advanced programming techniques, especially graphics, color, and voice technology. Also covers sound, scrolling, display lists, and details on cassette handling.

- **ZIMMERMAN, LANCE. ATARI: A BEGINNER'S GUIDE.** BRADY083, 12.95p.

This is a comprehensive tutorial for the 400/800. Written in a user-friendly style, this informal text is designed to help beginners understand all aspects and capabilities of the ATARI.

- **INMAN, DON and KURT. THE ATARI ASSEMBLER.** Index, 281pp. PRENTIC 81, 12.95p.

The Inmans demonstrate how to master assembly language programming and show how to use the ATARI Assembler Cartridge with an ATARI 400 or 800. The book is designed for readers with some knowledge of the BASIC programming language, but assumes no assembly language background.

- **HASKELL, RICHARD, E. ATARI BASIC.** SPECTRU83, 13.95p.

This book provides a solid introduction to BASIC programming on the ATARI. Haskell provides a hands-on, top-down approach to programming and his instruction is augmented by a wealth of examples which cover topics such as low and high resolution graphics, loops and arrays, sound effects, bar graphs, and animated graphics.

- **ROWLEY, THOMAS E. ATARI BASIC: LEARNING BY USING.** 73pp. IJG81, 5.95p.

This book provides a supplementary resource for learning BASIC programming on an ATARI. The short programs and learning exercises are easy to follow and make learning programming enjoyable. Hands on interaction with the computer is essential. Most of the programs are written using simple ATARI BASIC statements; a few use sophisticated programming techniques. To benefit from this book, the user should have an elementary knowledge of BASIC programming techniques. 16K of memory is required for some of the routines.

- **ALBRECHT, BOB, LEROY FINKEL, and JERALD BROWN. ATARI BASIC—A SELF-TEACHING GUIDE.** 332pp. WILEYJ079, 10.95p.

This book shows you how to read, write, and understand the ATARI BASIC programming language. The authors provide a clear, easy-to-follow self-teaching manual which has been published in conjunction with ATARI. Numerous applications and games are also included.

- **HELD, GILBERT. ATARI BASIC, QUICK REFERENCE GUIDE.** WILEYJ082, 2.95p.

This Quick Reference Guide is printed on heavy coated stock, making it a handy item to have alongside you at the keyboard. Among the areas presented are the following: generic terms, BASIC operators, file naming convention, system commands, BASIC language statements, sound parameters, I/O control, and graphics and video control.

- **TAYLOR, JOHN ATARI 400/800 DISKGUIDE**, 32pp. OSBORNE83, 7.95p.

This spiral-bound, computer-side guide contains all the important ATARI 400/800 commands and functions — DOS, ATARI BASIC, numeric functions, machine functions, and many others are all clearly summarized.

- **KOHL, HERB, TED KAHN, LEN LINDSAY, and PAT CLELAND. ATARI GAMES & RECREATIONS**. Many illustrations, index, 350pp. RESTON82, 14.95p.

This book offers a different approach to introducing programming to the beginning computer user. The authors encourage you to develop your own ideas for computer games and provide models from which to draw ideas for such games. You'll start with easy games that will serve as building blocks for more complex and creative programs. At the end of each chapter are sophisticated programs that will interest experienced programmers or beginners who want a challenge. You'll learn how to develop your own programming styles and have fun as you do it. And in the process you'll discover and master all the capabilities of your machine. In addition to games, there is a special section on the graphics, sound, and color features of your ATARI.

- **CONLAN, JIM and TRACY DELIMAN, et al. ATARI PILOT FOR BEGINNERS**. Index, 229pp. RESTON83, 14.95p.

This book teaches you how to give commands to your ATARI computer in the language known as PILOT. It is designed for users with an ATARI 400 or 800 home computer. PILOT is a fairly simple language which is designed to be easy to learn. The book allows the beginner to learn through play and experimentation, and all of the programs included in the book were tested by children and beginning adult computer users. Included are programs for music, color, graphics, and mathematics.

- **SCHREIBER, LINDA M. ATARI PROGRAMMING... WITH 55 PROGRAMS**. Index, 254pp. TABBOOK82, 13.95p.

This hands-on guide to programming the ATARI 800 assumes no prior computer knowledge. The first chapters acquaint the reader with the ATARI and the different accessories that can be attached to it. New terminology is introduced gradually. The following chapters teach basic programming concepts. Each one introduces a few related commands. An explanation of each command is followed by an example of the way to use the command. The programs included further illustrate the use of the command and each program is accompanied by a detailed explanation. Sound, color, and graphics are covered in several programs. A final chapter explains how to make programs crash-proof, and there's also an explanation of error codes.

- **MOORE, HERB, JUDY LOWER, and BOB ALBRECHT. ATARI SOUND & GRAPHICS—A SELF-TEACHING GUIDE**. Index, 234pp. WILEYJO82, 9.95p.

This excellent guide opens up the vast creative possibilities of artistic programming to owners of the ATARI 400 and ATARI 800—the most visually advanced home computers available today. With this self-paced, self-teaching guide, you'll advance progressively through simple techniques for creating an array of sounds and images. Even if you're a beginner with no computing experience, this easy-to-follow book lets you start seeing and hearing things on your ATARI right away. You'll learn how to compose and play melodies, draw cartoons, create sound effects and games, and progress to more sophisticated artistic programming. And because the book uses BASIC and requires no programming knowledge, you'll learn elementary BASIC programming in the context of each newly introduced technique.

- ATARI TECHNICAL USER'S NOTES**. Loose-leaf. ATARI81, (CO16555), 27.00

This information package provides details for the experienced programmer on the internal workings of the 400 and 800 computers. Also available from ATARI, source code listings for DOS and the operating systems.

- ELLIS, MARK, ROBERT ELLIS, JOEL GOLDSTEIN. ATARI USER'S GUIDE: BASIC AND GRAPHICS FOR THE ATARI 400/800/1200**. 300pp. BRADY83, 15.95p.

This comprehensive guide presents through an easy to read, yet detailed explanation. ATARI BASIC and graphics. This book covers specific information on the 400, 800, and the 1200XL computers, along with an outline on how a computer works. This guide also includes applications in graphics, word processing, and business.

- **STANTON, JEFFREY, ROBERT P. WELLS and SANDRA ROCHOWANSKY. THE BOOK OF ATARI SOFTWARE 1983**. Resource listing, index, 8½"x11", 347 pp. BOOKCOM83, 19.95p.

This is an exemplary resource manual. The software reviews have been prepared by computer professionals and each evaluation is written by an expert in the field. The programs are grouped by type. The major areas covered are business, education, communications, data base management, and entertainment. Each of the software critiques is lengthy and to the point.

- COMPUTE!'s FIRST BOOK OF ATARI**. Spiralbound, 192pp. COMPUTE!81, (094238600), 12.95
- Helpful information from the pages of COMPUTE! including applications and useful programs. Also included are unpublished articles and memory map data.

- COMPUTE!'s FIRST BOOK OF ATARI GRAPHICS**. Spiral-bound, 248pp. COMPUTE!82, (0942386086), 12.95
- This easy to use book provides programs, games, tutorials, and articles along with other helpful information for the experienced and inexperienced ATARI owner. Chapters cover animation, advanced graphics techniques, and redefining characters.

- COMPUTE!'s SECOND BOOK OF ATARI**. Spiral-bound, 250pp. COMPUTE!82, (094238606X), 12.95
- Previously unpublished information from the editors of COMPUTE! Magazine. Included are programs and helpful articles on graphics and game utilities.

- **LARSEN, SALLY GREENWOOD, COMPUTERS FOR KIDS: ATARI EDITION**. 11" x 8½", 82pp. CREATIV81, 4.95p.

This book is well-illustrated and easy-to-understand. The large type makes it accessible to children. Kids can find out how to put together a flowchart, and how to get a computer to do what they want it to do. They also learn the basics of computing and how to write their own games and draw pictures that move. There's also a section of hints for parents and teachers.

● **WILLIS, JERRY and MERL MILLER. COMPUTERS FOR PEOPLE.** Index, 200pp. DILITHI82, 7.95p.

This book would be suitable for anyone thinking of buying a small home computer, but it is most useful for those who are seriously looking at the ATARI. The book at times seems to be a promotional effort for ATARI, with many glossy color photographs of the ATARI and its peripherals throughout. The information is sound and reasoned and, while biased, is generally to-the-point and helpful. The authors begin by describing the many uses for computers in the home and office, emphasizing educational and game applications as well as business ones. One helpful feature of the book is a collection of suggestions for finding the computer that best suits your needs — an ATARI of course! The book concludes with an annotated resource guide and a glossary.

● **SMALL, DAVID and SANDY, and GEORGE BLANK, eds. THE CREATIVE ATARI.** Many illustrations, 8½" x 11", 250pp. CRCOMP83, 15.95p.

This book contains a collection of articles, columns, and tutorials on the ATARI which originally appeared in **Creative Computing** Magazine. The material is organized into four sections: an introduction, with a discussion of ATARI memory concepts essential to programming; a tutorial on ATARI graphics; a collection of programming tips; and a wealth of ready-to-run programs along with reviews of commercial programs available for the ATARI.

TOM ROWLEY, DESIGNS FROM YOUR MIND: ATARI GRAPHICS, RESTON

Two sections, the first for novices, the second covering advanced graphic techniques. A guide to graphics and color on the ATARI with chapters on combining graphics with text, player/missile graphics, and creating graphic shape tables.

DE RE ATARI. Many charts, 8½"x11", index, 150+pp. ATARI81 (APX90008), 19.95

This handbook for advanced programmers was written by Chris Crawford, Jim Dunion, and other specialists at ATARI. This series of tutorials covers, in detail, the techniques required to fine scroll, move player/missiles, operate vertical blanks, and fully utilize the potential of the ATARI 400 and 800 home computers. An indispensable manual for the advanced ATARI programmer.

FORTH ON THE ATARI: LEARNING BY USING, ELCOMP, 7.95

Covers the interesting language of FORTH for the ATARI. A language useful in manipulating graphics on the ATARI and programs that run much faster than BASIC. For beginners and those interested in becoming familiar with this advanced programming language.

● **ROBERTS, SAM D. GAMES FOR THE ATARI.** 115pp. IJG82, 7.95p.

This book is more than a mere listing of game programs. The first part provides clear instructions in techniques. Included are guidelines on drawing figures on the screen, movements, and sound. The selection of games is varied, and they take full advantage of the graphics and sound capabilities of the ATARI.

● **ROBERTS, SAM D. HOW TO PROGRAM YOUR ATARI IN 6502 MACHINE LANGUAGE.** 106pp. IJG82., 9.95p.

This book provides instruction in programming the ATARI in 6502 machine language. Also covered is the use of an assembler and the development of machine language subroutines from BASIC. The author provides thorough, hands-one guidelines.

● **CARRIS, BILL. INSIDE ATARI BASIC—A FAST, FUN, & FRIENDLY APPROACH.** 192pp. RESTON83, 12.95p.

This book intentionally avoids flowcharts, unnecessary technical details, and much of the computer jargon used in other books. The idea is plain language which the author hopes will lead to painless learning. The writing style is informal and humorous and all the basics are covered. Carris is Training Director with the Home Computer Division of ATARI.

INSIDE ATARI DOS. Spiral-bound. COMPUTE! (0942386027), 19.95

Written by the authors of the ATARI Operating system, this step-by-step book to the DOS system, is complete with comments and source listings. By Bill Wilkinson of Optimized Systems Software. An excellent guide to understanding the ATARI DOS.

● **CARLSON, EDWARD H. KIDS AND THE ATARI.** Spiral-bound, 218pp. RESTON83, 19.95p.

This lively introduction will have kids programming the ATARI in hours. Step-by-step lessons, exercises, and illustrations add to the book's utility as do the many games and homework drills. There are also notes for teachers and parents.

MAPPING THE ATARI. Spiral-bound, 194pp. COMPUTE!83, (0942386094), 14.95

The finest memory guide listing and sourcebook for the ATARI home computers. For programmers of all types, A.N.A.L.O.G. highly recommends this book. Crammed with information you can use on a daily-programming basis.

MASTER MEMORY MAP. 32pp. Educational Software, 6.95

Over 500 memory locations in an easy to read format. Helpful to beginning programmers in teaching which memory locations are important.

● **NORTH, ALAN. 101 ATARI COMPUTER PROGRAMMING TIPS & TRICKS.** 126pp. ARCSOFT83, 8.95p.

This is a collection of programming techniques and shortcuts for the ATARI 400/800, each featuring a complete, ready-to-run program. Included are techniques for graphics, games, educational tools, and home financial aids. It's a simple, straightforward account.

- **CAPITAL CHILDREN'S MUSEUM. PAINT.** RESTON. 39.95.

This software package for use on the ATARI 800 enables individuals who thought they couldn't draw a straight line to create colorful works of art. Utilizing the color capacities of the ATARI, the Capital Children's Museum of Washington D.C. has developed a software package which allows users to create their own computer paintings. The PAINT diskette provides access to hundreds of color textures, allowing users to produce a virtually limitless number of artistic patterns, textures, and variations. There's even a special way to save art once it has been created. An accompanying manual provides instruction and documentation. The software requires 48K and a joystick.

- **THORNBURG, DAVID D. PICTURE THIS! — AN INTRODUCTION TO COMPUTER GRAPHICS FOR KIDS OF ALL AGES.** Spiral-bound, index, 8"x11", 191pp. ADDISON82, 14.95p.

This book is designed as a handbook for those owning an ATARI 400/800 home computer. A remarkable combination of two modern educational tools, *PILOT* and *Turtle Geometry*, makes it possible to solve problems, create pictures, and invent games on your ATARI. *PILOT* is a powerful computer language that is simpler than BASIC and allows kids to talk with the computer. *Turtle Geometry* allows kids to create pictures in full color with a myriad of designs. It's a wonderful book which features a step-by-step approach which integrates projects throughout for constant learning reinforcement. And it's fun too!

MARK THOMPSON, PROGRAMMING YOUR ATARI COMPUTER, illustrated, 280pp. (080604532), 10.95

An introduction to computers and the ATARI in specific. Covers the fundamentals of BASIC, internal workings of the ATARI, and the ATARI peripherals. Program listings including two games are included.

- **POOLE, LON, MARY BORCHERS, and STEVEN COOK. SOME COMMON BASIC PROGRAMS: ATARI EDITION.** 8½" x 11", 200pp. OSBORNE81, 14.99p.

You can key these 76 short programs directly into your ATARI 400 or 800 computer and obtain a powerful collection of financial, statistical, and mathematics programs. Each program is presented with complete source listings, documentation, and sample execution.

STIMULATION SIMULATIONS: ATARI EDITION. HAYDON, 5.95p.

This book contains a dozen programs (games) in ATARI BASIC. The programs are well documented and are complete with listings, sample runs, instructions, and flowcharts. Several types of games are represented including space, fishing, and adventure.

- **NORTH, ALAN. 31 NEW ATARI COMPUTER PROGRAMS FOR HOME, SCHOOL, OFFICE.** 95pp. ARCSOFT83, 8.95p.

This book contains a collection of ready-to-run programs which are designed to be easily input into an ATARI 400 or 800. Included are programs for the home, classroom, or small business. Each is at a level accessible to novice users.

- **BOOM, MICHAEL. UNDERSTANDING ATARI GRAPHICS.** 4¼" x 11", 48pp. ALFREDP82, 2.95p.

This hands-on manual teaches you how to create graphics on ATARI models 400 and 800. The book is directed at beginning and intermediate programmers. You will need to know ATARI BASIC, though you do not have to have prior programming experience. The book begins with basic terms and concepts important to graphics programming. Next it examines each of the ATARI BASIC commands used for generating video graphics. Final sections provide additional tips.

- **BEIL, DONALD H. THE VISICALC BOOK: ATARI EDITION.** Many illustrations, index, 313pp. PRENTIC82, 14.95p.

Personal computer users and hundreds of businesses across the U.S. are discovering a wide variety of uses for VisiCalc software. With VisiCalc, you design the model you wish to use, so you are able to examine every step of your business operations. If you are presently using VisiCalc on your ATARI home computer, and want to learn more about its expanded uses, or are thinking about purchasing VisiCalc, this book should be very helpful. It will show you how to build a model, enter your data, and begin to explore various business and financial questions. The book includes many practice problems and a wealth of illustrative exercises.

- **POOLE, LON, MARTIN McNIFF, and STEVEN COOK. YOUR ATARI COMPUTER: A GUIDE TO ATARI 400/800 PERSONAL COMPUTERS.** Many illustrations, 464pp. OSBORNE, 16.95

One of the most comprehensive books concerning the ATARI ever written. Between the covers one can find a wealth of information which is organized and written in a clear, concise manner. This 11 chapter book covers graphics (beginner and advanced), BASIC, sound, and the ATARI peripherals. The finest book for novice ATARI owners.

● The above list was excerpted from **Computers: A Comprehensive Guide**, written and provided by Cris Popenoe, Yes! Bookshop, 1035 31st St., NW, Washington, DC 20007. These and over a thousand other computer related books are reviewed in the guide and are available by mail order or by calling (202) 338-2727.

EXPLORE A NEW DIMENSION IN SOFTWARE

Action!

INTRODUCING ACTION! — Now the fastest 8-bit language

Another first from OSS! ACTION! is a brand new language designed to run on 6502-based computers, including Atari, Apple II, and Commodore 64. A powerful, structured language, ACTION! can draw out a new, higher dimension of performance from these machines, with speeds never seen before. ACTION! combines some of the best features of such languages as Pascal, C, and Algol, and offers speeds over 100 times faster than BASIC interpreters.

ACTION! is ideal for games, music processing, real-time control, and many other applications. But if what you're really looking for is raw speed in compiled code, ACTION! is just for you. There's more . . . ACTION! comes with a 128-column screen editor which rivals word processing programs, as well as a monitor mode which allows you to choose between on-line activities. ACTION!'s unique one-pass compiler will accept code from memory, disk, or cassette, and ACTION! has the ability to include source library files.

ACTION! is provided in cartridge form only. Introductory price for ATARI Version \$99.00

Call or write for availability of Apple II and Commodore 64 Versions.

A Strong Software Family

Other major systems software products from OSS include:

BASIC A+

the only logical upgrade to Atari BASIC with extra features for games and business programs....\$80.00

C/65

the first native mode "small c" compiler for Atari and Apple computers....\$80.00

MAC/65

the finest and fastest complete 6502 macro assembler/editor package you can buy....\$80.00

BUG/65

a powerful, self-relocatable debugger. FREE with MAC/65....\$34.95

And More...

OS/A+, the first and finest operating system for BOTH Atari and Apple II computers, is NOW included FREE as a part of every OSS systems software package. OS/A+ features a keyboard-driven, easy-to-use command processor, several simple resident commands, and logical and readable requests for even the most sophisticated utility commands. Versions of OS/A+ for some higher capacity drives are available at extra cost.

NOTE: Unless otherwise noted, all OSS products require 48K and at least one disk drive.

ASK YOUR DEALER, or call or write for our brochure.

by **Brian Moriarty**

Since the publication of my article on **Disk Backup Programs** in Issue #11, our office has been swamped with phone calls and letters from readers interested in the technology of software protection. Many of these people had questions about disk drive modifications — and nearly everyone wanted to know more about a mysterious product called “the Happy Drive.”

At first we were hesitant to publish reviews or advertisements for the Happy 810 Drive Enhancement because of its unique potential for misuse. But after receiving a sample unit from Happy Computing and working with it for a couple of weeks, we decided that the legitimate performance benefits it offers are too significant to ignore. We hope this article will help clear up some of the misinformation surrounding the Happy drive, and that it will encourage the ATARI community to deal with the existence of such products in an intelligent, informed manner.

Learning how to read.

The Happy Enhancement is a plug-in circuit board that completely replaces the operating system of the ATARI 810 Disk Drive. It's designed to improve the efficiency of disks reads, provide a greater degree of control over disk formatting and reduce wear and tear on the drive mechanism.

To better understand how the Happy Enhancement works, let's take a look at the way an unmodified 810 reads a disk.

An 810 read operation begins when your ATARI commands the drive to fetch a particular sector. The controller system inside the 810 physically positions the read/write head over the track containing the requested sector, and waits for that sector to pass over the head. Then it reads the sector data into the 810's 128-byte disk buffer, checks the data for accuracy and dumps the contents of the buffer into the ATARI over the serial bus.

This method of disk reading works fine if all you need is a single sector. But most disk operations consist of multiple reads, in which several consecutive sectors must be pulled off the disk. It takes time to transmit those 128 bytes of sector data over the serial bus; during this period, the spinning disk may have carried the next physical sector away from the drive head. That means you have to wait a few fractions of a second between each sector access so that the disk can “catch up” with the read requests.

One way to improve the speed of disk reads would be to carefully interlace consecutively-numbered sectors on the tracks, so that sectors would pass over the head just as the drive was ready to read them. ATARI did just this when they released the revision “C” OS ROM for the 810 back in 1981. C-formatted disks boot up noticeably faster than disks prepared with the original “B” ROMs. But it still requires several complete disk revolutions to access every sector on a given track.

The Evelyn Wood solution.

The Happy 810 Drive Enhancement represents a complete re-thinking of the 810's disk-read process. Instead of the 128-byte disk buffer used by a normal 810, the Happy Enhancement incorporates a 4K buffer that can easily store an entire track's worth of data (18 sectors or 2304 bytes) all at once.

When a Happy drive is commanded to fetch a particular sector, it actually reads the entire track containing that sector into its giant buffer. This 18-sector “batch” read requires an average of only 1.05 disk revolutions! Subsequent sector requests from the same track are pulled out of the buffer, not off the disk. This means that the speed of sequential disks reads is limited mainly by the data transfer rate of the serial bus.

What does Happy's batch-read capability mean to you, the 810 user? Figure 1 shows the amount of time it takes to boot in the ATARI DOS.SYS and DUP.SYS files with and without the Happy Enhancement, using disks formatted under both versions of the 810 OS ROM. Figure 2 compares the speed of initializing a disk using DOS option “I.”

Figure 1. DOS/DUP.SYS boot speeds

B-format, without enhancement	18 seconds
C-format, without enhancement	14 seconds
Either format, with enhancement	11 seconds

Figure 2. Disk formatting speeds.

Without Happy enhancement	38 seconds
With Happy enhancement	25 seconds

One of the nice things about a Happy drive is that it doesn't work as hard as a normal 810. That translates directly into longer equipment life. The difference is most dramatic when performing an intermittent disk read operation, such as ENTERing a file with BASIC or LOADing screens into a FORTH compiler. It's strange to watch the drive motor shut off while the computer continues to "beep," busily reading sectors out of Happy's 4K buffer. Happy Computing estimates a 30% reduction in drive wear over a standard 810.

The Happy Enhancement only affects the speed of disk read operations. Disk writes take place at the same miserably slow speed as an unmodified 810. Also note that a disk which has been DOS-formatted with a Happy drive will not boot faster on a normal drive, because Happy's DOS format is the same as the one used by the ATARI "C" ROM. I emphasize "DOS format" because, unlike a normal 810, this is not the only format a Happy drive knows how to write.

Custom disk formats.

The Happy drive's most controversial feature is its ability to recognize and reproduce non-standard disk formats. Happy's programmable operating system allows you to access individual sector ID headers, timing information and other parts of a disk you can't touch with a conventional drive. This means that, for the first time, ordinary folks like you and me can create special disk formats to meet the needs of a specific application. It also means you can recreate anybody else's special format, including those used for the purpose of copy protection.

The basic Happy 810 Enhancement kit comes with a disk program called Happy Backup. Happy's advertising says this program is "guaranteed to produce executable backup copies of any disk which can be read with a standard ATARI 810." The duplicate becomes a magnetic image of the source, and includes all protection features which may have been encoded into the original disk. I tried Happy Backup on a number of disks in my software library, including those incorporating the latest in professional custom formatting. The performance of the copies fully justifies Happy Computing's claim.

The flip side of the Happy Backup disk has a routine that lets you program the Happy drive to act just like a standard 810. This makes the system compatible with software that expects the disk-read process to take place at a "normal" speed — and prevents clever software publishers from detecting the presence of the Happy Enhancement. A diagnostic program is also included to verify that the drive is working properly.

An extra \$99.95 will get you Happy Customizer, a program that works together with a Happy-enhanced drive to create non-standard disk formats on a track-by-track basis. The Customizer is great for

small software publishers who want to protect their products without resorting to a high-priced duplication house. You can experiment with super-efficient sector interlacing schemes and other exotic formatting techniques to improve the performance of your disks.

Owners of more than one Happy drive can order a multi-drive version of Happy Backup for \$49.95. This high-speed utility will let you make up to three duplicates of a standard DOS-format disk in about 2 1/2 minutes! And the Happy Compactor package (\$49.95 additional) lets you combine several boot-load programs onto a single menu-driven disk.

The installation instructions for the Happy 810 Enhancement are among the best I have ever seen. The procedure requires no soldering or special tools; you simply remove the original 810 OS chips, plug the Happy board into the empty sockets, re-install two of the chips and put the drive back together. The Happy board uses good quality components and gold-plated connectors in the places where they count most.

Is it worth \$250?

Prospective owners of a Happy 810 Enhancement should think carefully before spending. \$250 is a significant fraction of the cost of a second disk drive — and two disk drives are probably more useful to the average ATARI user than a single Happy drive. However, if you already own two or more 810s, I think you'll find the high speed and special capabilities of a Happy drive to be a worthwhile investment.

The Happy 810 Enhancement is one of the most powerful hardware modifications available to ATARI computer owners. I hope the ATARI community will not abuse this power by using the Happy drive (and other similar products) to infringe on the rights of others. If Happy users operate their equipment with fairness and maturity, we will continue to enjoy the high caliber of hardware and software engineering that makes products like the Happy Drive a pleasure to use. □

HOME COMPUTER OMNIMON!™

A RESIDENT MONITOR

Software: DAVID YOUNG
Hardware: BILL WILLIAMS

- OMNIMON! is **resident**. It is a PC board which installs permanently into your computer but requires no user memory. Resides in unused \$C000 page.
- OMNIMON! gives you **complete control**. Interrupt, examine and manipulate any program in memory or on disk! Enter monitor with SELECT/SYSTEM RESET.
- OMNIMON! can aid **recovery** from errors and glitches! Very **user friendly**!
- OMNIMON! has **flexible disk I/O** independent of DOS. Supports SD or DD and sequential or linked modes. Load DOS file, boot record or edit sector data! Create a sector map of any file or boot disk. Dump memory to disk.
- OMNIMON! has many **debugging tools**: display/alter memory or 6502's registers, disassembler, search memory, single step, printer dump, etc.
- OMNIMON! — TM of CDY Consulting 214-235-2146, 421 Hanbee, Richardson, TX 75080. **Dealer inquiries solicited**. Price: **\$99.95**. ATARI is TM of ATARI, Inc.

MACHINE LANGUAGE UTILITIES

for ATARI 400/800/1200.

Vervan utility programs require no software modifications and are a must for all serious ATARI BASIC programmers.

CASDUP 1.0 & 2.0 To copy most BOOT tapes and cassette data files. 1.0 is a file copier. 2.0 is a sector copier. Cassette only \$24.95

CASDIS To transfer most BOOT tapes and cassette data files to disk. Disk only \$24.95

FULMAP BASIC Utility Package. VMAP-variable cross-reference, CMAP-constant cross-reference (includes indirect address references), LMAP-line number cross-reference, FMAP-all of the above. Will list "unlistable" programs. Also works with Editor/Assembler cartridge to allow editing of string packed machine language subroutines. All outputs may be dumped to printer. Cassette or Disk \$39.95

DISASM To disassemble machine language programs. Works with or without Editor/Assembler

cartridge. May be used to up or down load single boot files. All output can be dumped to printer. Cassette or Disk \$24.95

DISDUP For disk sector information copying. May specify single sector, range of sectors, or all. Copies may be made without read verify. Disk \$24.95

ATARI 400/800 are Trademarks of ATARI, Inc.

Learn to program the ATARI™ in 6502 Machine Language & BASIC.

Three new ATARI books for the serious programmer and beginner, are now distributed by IJG, for use with the ATARI 400 and 800 microcomputer systems.

ATARI BASIC, Learning By Using. This is an action book. You program with it more than you read it. You use it, you discover with it, you create it. Learn ATARI BASIC easily through the short programs provided. A great source of work problems for teacher or student. 73 pages. ISBN 3-92-1682-86-X \$5.95.

Games For The ATARI. Provides ideas on how to create your own computer games. Contains primarily BASIC examples but, for very advanced programmers, a machine language example is included at the end of the book. 115 pages. ISBN 3-911682-84-3 \$7.95.

How to Program Your ATARI in 6502 Machine Language. To teach the

novice computer user machine language, the use of an assembler, and how to call subroutines from the BASIC interpreter. 106 pages. ISBN 3-92-1682-97-5 \$9.95.

IJG products are available at computer stores, B. Dalton Booksellers and independent dealers around the world.

If IJG products are not available from your local dealer, order direct. Include \$4.00 for shipping and handling per item. Foreign residents add \$11.00 plus purchase price per item. U.S. funds only please.

TOTAL STRING SEARCH

16K cassette 24K disk

by Jerry Tucker

The introduction of an ATARI 800 into my life certainly gave new meaning to my concepts of entertainment, education and free time. Just like everyone else that first makes the big plunge, I OD'd on games for the first month. I tinkered around with BASIC and removed my hat in awe whenever that mystical entity "MACHINE LANGUAGE" was mentioned. I did my best to learn BASIC and used it exclusively for all my programming attempts (after all, I was a practical man and realized my limitations). Following two or three extensive programming projects I began to notice some of the inherent limitations of programming strictly in BASIC. I also noticed quite a few assembly language listings in monthly magazines for utilities that might possibly "spruce-up" my BASIC programs. The machine language routines often had a BASIC program that would READ the machine code from DATA statements with a FOR...NEXT loop and then POKE it into PAGE 6 or inserted it into a STRING. My curiosity got the best of me and I started entering a few into my magic machine. I was duly amazed at the difference in the speed at which the machine language executed the routines compared to their BASIC counterpart. I was, however, totally befuddled by all the PLA, STA, BEQ, and LDXs so I looked for published listings of utilities which met the needs of the program I was working on at the time.

The hammer fell when I began to develop a utility that was designed to store a large amount of data. The program was required to search all of the data for a term and then display that term and the associated data field. The program was completed with a minimum of difficulty, however, the BASIC search through the complete data file took almost two minutes. There were ways to speed up the search but most involved searching only a portion of the data field which would not always uncover a term that could be buried anywhere in the data. The logical solution was to use machine language for the search and call it from BASIC with a USR statement. I remembered reading a few articles on searches so I gathered all of them together and looked for a listing that was tailor-made for my program. They were all excellent programs and displayed their capabilities

very graphically, but none would search through my data, find a term buried in that data and returns its location in such a manner that the associated data field could be displayed. As you might expect I was now hooked and so began my submersion into machine language.

I bought and read everything I could lay my hands on that related to 6502 machine language programming. I also chose an assembler and began to experiment with searches. After many long hours and trips into never-never land the "light came on at the end of the tunnel" and Listing 1 is the final result. I have included extensive comments to help the reader follow the logic and program flow. Parts of the code might appear to be extra steps, but this was done to keep the program RELOCATABLE. This allows the use of a STRING for storage, and frees PAGE 6 for other uses.

Listing 2 is a combination BASIC loader for the SEARCH code and a demonstration of its speed. It creates a long string of characters (A\$) and asks for the input of a term (DT\$) which is randomly placed within A\$. You are then given the option of printing A\$ or going right to the search. Be warned that if you choose to print A\$ it will take a little time for all of those 10,000 characters to be printed. You will then be asked to enter any part of the entered term and when RETURN is pressed the search will begin. The machine language routine is called by line 160: C=USR[ADR(B\$), CNT, ADR(A\$), ADR(DT\$), RL, DTL]

1. ADR(B\$) is the address of the start of the machine language code.
2. CNT is the total number of records defined as the length of A\$ divided by the record length.
3. ADR(A\$) is the address of the long string.
4. ADR(DT\$) is the address of the desired term.
5. RL is the record length.
6. DTL is the length of the desired term.

The program will return in the blink of an eye with the location of the LAST occurrence of the desired term.

"Ah ha!" you respond. "What if the record I want is not the last occurrence of the term?" This could happen if the routine was used with a phone list and the only term known was the first name. Listing 1

will return only the location of the last occurrence of the name. A solution is to print every occurrence of the desired term which is accomplished with the addition of the 17 assembly instructions in Listing 3. These PRINT codes are inserted in the "FOUND" section in Listing 1 and 5 other changes are also made to keep the program relocatable. The PRINT section uses the ATARI's resident machine language subroutine that prints to the screen. In order to use this addition you must format your records with a CHR\$(0) (entered as a CTRL, [,]) as the last character. This signals the PRINT routine that the end of the record has been reached and to return to the search and look for another match. Listing 2 is not written to accomodate this requirement and will return some bizarre results if tried.

Listing 4 is a BASIC subroutine that will load the code that is generated by the combined SEARCH and PRINT program. The machine language is inserted into a string in a similar manner to Listing 1. The call from BASIC is also the same.

The frustrations and long hours are now behind me and I must say I totally enjoyed the development of these programs. Maybe I have only scratched the surface of machine language, but I have found a new direction for my programming efforts. □

CCA Data Management System
CE Software
238 Exchange Street
Chicopee, MA 01013
40K BASIC \$99.50

Along with wordprocessing and electronic spreadsheet applications, database systems are the most generally useful computer tools in an office, small business, or home management setting. Programs that allow the creation and manipulation of sets of data (databases) have a broad range of uses — from maintaining simple files like recipes and car expenses to complex business files such as accounts receivable and campaign contributions.

Database systems allow the user to establish a file, for example an address list. That file will be made up of records in a specific format which the user sets up. The record will consist of fields, each with a field name (like name, address, city, zip and phone) and a specified length. The database system will allow sorting the records to put them in the most useful order, searching for specific records or groups of records, and printing labels or columnar reports with each column representing a field.

There are four major database systems currently available for the ATARI computer. All are what would traditionally be called file management systems. Other types of database systems (multi-file, relational and network) allow the user to access more than one data file at a time. Although a variety of less sophisticated ATARI database systems are available, many of them are limited to specific tasks and do not have the flexibility and capabilities of the products described below.

General information about the four products is provided in Table 1. Note that throughout the tables included in this article, certain specifications are shown in brackets [] or parenthesis (). Brackets indicate functions to be contained in a new release, like CCA DMS version [4.2] to be released in 1983, while parenthesis mean that the text explains the feature more fully.

TABLE ONE — GENERAL INFORMATION

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
Price	\$99.50	99.95	99.95	129.00
Version	4.1 [4.2]	1.2	4D	2.0
Minimum memory required	40K	32K	40K	48K
Language (machine language subroutines)	BASIC*	Machine	BASIC*	Machine
Are error messages displayed?	Yes	Yes	Yes	Yes
Number of loads or programs	5(2 disks)	1	3	1
Does program use colorful displays?	No	No	Yes	No
Is program menu driven?	Yes	Yes	Yes	Yes
Is standard ATARI DOS used?	Yes	No	Yes	No
Is the program diskette copyable?	Yes	No	No	No
Maximum number of drives supported	2[4]	2	4	4

One of the most important features of powerful database systems is the quality of documentation provided. Ideal documentation would include a step by step tutorial which teaches the most commonly used commands, a glossary which lists and describes commands and functions alphabetically, a detailed index, a quick reference card which can be kept close at hand and a listing of the source code so the user can investigate the workings of the program and

modify it to fit specific needs. Table 2 compares the documentation available with the programs. None of the manuals fit the ideal — this is a case where quantity is as close as you get to quality.

TABLE 2 — DOCUMENTATION

Feature	CCA DMS	Data Perfect	File- Manager +	File Fax
Pages of documentation (size of page)	63 (8.5x11)	139 (8.5x11)	103 (6x9)	139 (6x9)
Is source code available and modifiable?	Yes	No	No	No
Is a quick reference card provided?	No	No	No	Yes

In all four cases, the written documentation contains sections which describe major program functions with examples. Most of the CCA DMS documentation is devoted to descriptions of cryptic messages, like "FMI 60," arranged in numerical order and not indexed by function. The bulk of the documentation for *Data Perfect*, *File-Fax* and *FileManager +* is divided into sections by program function. *Data Perfect's* manual is the only one which contains an index. *FileManager +* provides additional summaries of major operations and a command glossary. *File-Fax* is the only program which provides a quick reference card or which has help screens built into the program. However, they list only the commands used by all computer versions of *File-Fax* and not the ATARI-specific commands. The documentation for all four programs comes in high quality ring binders and all but *File-Fax* have tabbed sections.

The first limitations of a database system will be encountered when you have to decide just what information you are going to store and in what format the program will allow you to enter it. Basically, database systems allow you to create a form with labeled blanks. Each time you fill in the blanks, a record is created. You may create records until some limit (available RAM or disk space) is reached.

Table 3 shows the limits of each program's record and file management. CCA DMS, *Data Perfect* and *File-Fax* each limit the user to less than one full screen of data. *FileManager +* allows the data for each record to spread across parts of as many as nine pages (screens); however, many program functions allow the user to manipulate files based only on information contained on the first screen. To some people maximum record length, in order to fit in all the relevant data, is critical. But as records get longer, the maximum number of records in a file decreases, reducing the utility of maintaining a database.

Another characteristic which establishes the utility of a database system is the maximum number of fields allowed in each file. All four programs are well suited to handle name and address files which

have short field lengths and few fields. If you will be creating files with a lot of text, *FileManager +* is a strong candidate, but if you need many fields, say to accumulate answers from a multiple choice/short answer questionnaire, then *Data Perfect* or *File-Fax* may be better. *File-Fax* is the only program which allows long field names, but the combined length of the field and its name can not be more than 40 characters. The other three programs limit you to short field names, which are later used for report headings.

TABLE 3 — GENERAL SPECIFICATIONS

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
Maximum record length (characters)	249	511	2000	879
Maximum field length (characters)	110	127	100	40
Maximum number of fields per record	24	32	20	31
Maximum field name length	15 (+5 ID)	12	12	39
Maximum number of formulas per file	245 bytes	16	5	0
Maximum # of level breaks (subtotals)	1	4	0	1
Maximum # of database files on one disk	64	1	12	1
Maximum size of a database file	1 disk	1 disk	1 disk	4 disks

Usually if the field name is longer than the field, the heading will truncated when reports are printed. CCA DMS overcomes this by requiring the user to specify a five character ID. This ID is substituted for the field name of short fields when reports are printed. *Data Perfect* allows the user either to use field names or to specify any other headings when reports are printed. *File-Fax* requires that report headings be typed separately from field names.

Within each record, certain fields may be established to contain formulas. The user may create two fields, price and tax, so that when data is entered into the price field, the tax field (.05 times price, for example) is automatically calculated. Later when reports are printed, level breaks for subtotals may be inserted. CCA DMS, *Data Perfect* and *File-Fax* allows the user to choose whether or not to verify by the program. You simply tell the program that each time that the field "Purchaser Name" changes, it should subtotal all numeric fields (i.e. "Quantity," "Purchase Price" or whatever other fields you may have set up).

None of the programs except *File-Fax* will allow you to have a file larger than can fit on one diskette. *File-Fax* allows data files to span up to four diskettes, but you must have a corresponding number of disk drives. *Data Perfect* and *File-Fax* also limit you to only one data file, with corresponding report and label format files, on each disk. Both Programs use a non-standard DOS. LJK DOS allows a few extra bytes to be stored in each disk sector and

allows the program to run faster, but limits the number of files on each disk. *File-Fax's* DOS uses a data compression scheme which substantially increases disk storage capacity. Although CCA DMS will allow 64 files on a disk, several small files (for pointers, report formats, etc.) will be needed for each data file.

Capabilities of the programs relative to the creation and editing of files are shown in Table 4. *Data Perfect* and *File-Fax* let the user design the layout of the screen by placing fields in any desired position. This allows formats like three columns each containing ten short fields. Further, during data entry with *Data Perfect*, fields will be entered in the order in which they were created. If you want to enter data into the bottom field first and work your way up, *Data Perfect* allows you to establish a format which will do so.

TABLE 4 — CREATING AND EDITING RECORDS

Feature	CCA DMS	Data Perfect	File-Manager +	File-Fax
User designed screen mask?	No	Yes	No	Yes
All keyboard editing features allowed?	Yes	Most (+)	Most	Yes (+)
Edit or delete records individually?	Yes	Yes	Yes	Yes
Edit or delete records globally?	Delete	Yes	No	No
Are locked fields allowed?	Yes	No	No	No
Are repeating fields allowed?	No	Yes	Yes	(Yes)
Records saved to disk when entered?	Yes	Yes	Yes	Yes
Are you forced to have a back-up disk?	No	Yes	No	No

One of the real strengths of the ATARI is its advanced keyboard editing. This includes features like full cursor movement, insertion of characters and lines, and deletion of characters and lines, CCA DMS and *File-Fax* allow the use of all such features, but inserting or deleting lines during data entry with CCA DMS can create an incorrect record.

Data Perfect allows the use of all keyboard editing features except insertion and deletion of lines. Additionally, it provides several nice features like go to beginning of line, go to end of line and enter line up to cursor. *File-Fax* also provides extra editing features like home and back tab. *FileManager +* prevents inserting or deleting either lines or characters during data entry, but allows the use of those features when creating report or label formats.

Data Perfect, as well as the upcoming version of CCM DMS, will allow the global deletion of records. In other words, you could delete from a file all records in which the field "Zip Code" is 33333. Additionally, *Data Perfect* allows global editing. All products with a sale price of \$29.95 could automatically be changed to \$34.95.

Only CCA DMS allows the creation of locked fields — once data is entered into them, it cannot be changed without the field being unlocked. If you wanted to enter names and social security numbers into a customer file, someone else could later enter addresses and other data. You could prevent that person from accidentally changing a social security number by declaring it a locked field. On the other hand, *Data Perfect* and *FileManager +* allow the user to specify repeating fields.

When a blank screen mask appears for the entry of a new record, certain fields can already be filled in — you will not have to type those fields unless you want to change them. If you are entering addresses, ninety percent of which are in New York City, you could specify both the city and state fields as repeating and you would only have to enter those fields ten percent of the time. *File-Fax* can be set up to default to the previous data each time a new record is entered, but specific fields can not be selected. *File-Fax* also allows the user to choose whether or not to verify the accuracy of each record as it is entered.

FileManager+, *Data Perfect* and CCA DMS all have mathematical capabilities. Table 5 displays these in detail. All three programs allow the basic functions of addition, subtraction, multiplication, division, and exponentiation. Only *Data Perfect*, however, will allow you to place commas in long numbers. Both *FileManager +* and *Data Perfect* will recognize parenthesis in mathematical formulas as establishing priority of operation. Formulas in CCA DMS must be entered in the exact order in which operations are to occur. Although *File-Fax* can total numeric fields, it will not be able to accept formulas within fields until a planned utility disk becomes available.

TABLE 5 — MATHEMATICAL CAPABILITIES

Feature	CCA DMS	Data Perfect	File-Manager +	File-Fax
May one computed field reference another?	Yes	Yes	Yes	NA
Can program put commas in long numbers?	No	Yes	No	No
Do parenthesis set priority?	No	Yes	Yes	NA
# digits before defaulting to exponent	10	9	10	No limit
+ - *	Yes	Yes	Yes	No
Exponentiation	Yes	Yes	Yes	No
Square roots	No	Yes	Yes	No
Log, base 10	No	Yes	Yes	No
Log, base "e"	No	Yes	No	No
Sine, cosine and arctangent	No	Yes	No	No
Integer and absolute values	Yes	Yes	Yes	No
SGN (-1 for negative, 0 for positive)	No	No	Yes	No
RND	No	No	Yes	No
Boolean functions	No	Yes	No	No

A major advantage of an on-line database is that it allows you to search for and retrieve specific data. The less detail you have to remember about the data for the program to find it, the more powerful and

useful the program is.

Table 6 compares the search capabilities of the database systems. Searching by range of data means requesting such information from the file as all birthdays between October 15, 1949, and December 23, 1954. *FileManager +*, *File-Fax* and *Data Perfect* allow you to specify multiple levels like all files where the first name is Jim and the area code is 202. These three programs also allow wild card searches. You could add to the two criteria above the requirement that the last name start with an "H." *Data Perfect* and *CCA DMS* assign each record a number so you can also specify that as a search criterion.

TABLE 6 — SEARCH CAPABILITIES

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
Search by range of data?	No	Yes	Yes	Yes
Maximum number of search criteria	1	9	5	31 (1/field)
Max number search criteria in 1 field	1	2	1	1
Are wild card searches allowed?	No	Yes	Yes	Yes
Can you search by record number?	Yes	Yes	No	No
Total fields in records found in search?	No	Yes	No	No
Print selected records during search?	No	Yes	Yes	Yes

Once data has been entered into a database system, the speed with which virtually any operation (searches, printed reports, etc.) is completed depends upon the physical ordering of the records in the file. Normally, records are saved in the order in which they are entered, not in alphabetical order. To make records more accessible, all database systems allow the records to be sorted. An accounts receivable file, for instance, may be sorted so that the records are in alphabetical order by the field "Company Name." If each company has several accounts, those may be placed in order by amount. In other words, there may be a primary sort of criterion, within which is a secondary criterion, within which . . . and so on. *CCA DMS* allows ten such sort criteria; and *File-Fax*, eight; twice as many as *FileManager +* or *Data Perfect*. All of the programs except *File-Fax* allow a subfile to be created easily from a larger database. From your original accounts receivable file, you could create a separate file of accounts which are over ninety days old.

Sorts have two possible results. The individual records may be written to the disk in their new (sorted) order or a pointer file may be created. With a pointer file, the records are not written in the new order. Instead, a short file containing the positions of the records which the sort identified as first, second, etc. points to the records which are still arranged in the original order. It's like having a file cabinet where the folders are numbered instead of being in alpha-

betical order. When you want to find the file on aardvarks, you look up that word in a 3x5 index (pointer) file and find that the aardvark folder is number 702. The folders are not alphabetized — the index cards are and act as pointers. For the primary sort of criterion, both *Data Perfect* and *CCA DMS* rewrite the records in their new order. *FileManager +* and *File-Fax* create pointer files while leaving the records in the order in which they were originally entered.

The sort capabilities of the four database systems are shown in Table 7. The accuracy of a sort depends on the depth of the sort. Say you want to put an address file into alphabetical order by last name. The field "Last Name" is 25 characters long. You can alphabetize using all 25 characters, or just the first twelve, or five. As your data files grow longer, this is an important feature. The longer your file, the fewer characters the database system will sort on. With an address file of 100 records, you may be able to sort on a maximum of 255 characters. When that address file grows to 1100 records, the sort may be limited to twenty characters. All of the programs except *File-Manager +* interact with the disk as they sort, thus allowing sorts of more records than can exist in memory at one time. *File-Fax* always sorts on the entire field length, but, with some loss of speed, is able to do so even for an eight level sort.

TABLE 7 — SORT CAPABILITIES

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
User controls depth of sort in a field	Yes	Yes	Yes	No
Sorts more files than memory can hold?	Yes	Yes	No	Yes
Maximum number of sort criteria	10	4	3	8
Allows creation of subfiles?	Yes	Yes	Yes	No
Ascending sorts (A-Z) allowed?	Yes	Yes	Yes	Yes
Descending sorts (Z-A) allowed?	Yes	Yes	No	No

Other than for casual uses of database systems, their most important feature is the ability to produce printed reports in useful formats. Table 8 gives a fairly self-explanatory comparison of report generation features. All four programs allow you to search for and print certain records from your file or the whole file. *Data Perfect* has the most flexible report features including the ability to edit a report format which was saved to disk, breaks between pages without sending printer control codes, the largest report title and the most subtotal levels. *Data Perfect's* report titles can have up to seven header lines (plus two detail lines), where each line is up to 127 characters. Not all printer control codes have to be included in that title format as they do with *File-Manager +*. *File-Fax* reports can be listed to the screen either with or without wrap around.

TABLE 8 — REPORTS

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
Search allowed for report?	Yes	Yes	Yes	Yes
Can report format be saved to disk?	Yes	Yes	No	Yes
Can saved report format be edited?	No	Yes	NA	Yes
Allows sending printer control codes?	Yes	Yes	Yes	Yes
Change printer fonts within report?	No	Bold only	No	No
Can pages be automatically numbered?	Yes	Yes	No	Yes
Automatically breaks between pages?	(No)	Yes	(No)	Yes
Can user set # of lines between records?	No	Yes	Yes	Yes
Automatic dating of report by program?	No	Yes	No	No
Maximum width of printed report	150	127	132	132
Maximum # of characters in report title	120	7 lines	37	132
Maximum # of level breaks (subtotals)	1	4	0	1
Can report be listed to screen?	Yes	Format only	Yes	Yes
If report is listed to the screen, are fields broken in the middle?	No	NA	Yes	No

A specific type of report often used is the preparation of labels — commonly for mailing. Labels require that the fields to be printed be stacked one above the other rather than printed in the usual columns. Each of the four programs allows easy formatting and printing of labels. Features related to labels are shown in Table 9.

TABLE 9 — LABELS

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
User designs layout of fields on label?	Yes	Yes	Yes	Yes
Maximum number of fields on label	24	32	(20)	31
Search allowed for label?	Yes	Yes	Yes	Yes
Print labels on specified conditions?	Range only	Yes	Yes	Yes
Is totaling allowed on break fields?	No	Yes	No	Yes

File-Fax allows you to toggle to the data entry screen, "pick-up" any field, and then drop it on your label format screen. One convenient feature of *File-Manager +* is that when you are setting up either label or report formats, you only have to type the first letter or two of the name of each field to be printed. The program matches the letters with its list of field names and completes the typing for you. All *FileManager +* fields which are to appear on labels must be on the first page (screen) of the record. (Remember that *FileManager +* records may be up to nine screens or 2000 characters long.)

Once you have built your database file and used it for a while, you will undoubtedly find that it needs to be modified. A certain field will have become unnecessary and will be occupying valuable space. Or you will think of another field that should be included and wish that you could go back and add it without reentering all of your data. You might even want to merge two existing files with the same or similar formats into one big file.

Table 10 shows which modifications each database system allows. An upcoming *File-Fax* utility disk will allow existing databases to be modified. All of the programs except *File-Fax* require that database files be packed in order to get rid of deleted records. During the editing process, deleted records are merely flagged. They are not erased from the disk file because that would leave a hole in the middle of your data. Packing the file removes each deleted record and moves the following files forward into the blank space. *File-Fax* automatically packs data files without requiring a separate step.

TABLE 10 — MODIFY EXISTING DATABASE

Feature	CCA DMS	Data Perfect	File- Manager +	File- Fax
Can database files be merged?	Yes	Yes	Yes	No
Pack database (remove deleted records)?	Yes	Yes	Yes	Automatic
Can fields be renamed?	No [Yes]	Yes	Yes	No
Can field length be changed?	No [Yes]	Yes	Yes	No
Can fields be added or deleted?	No [Yes]	Yes	Yes	No

A final topic which concerns many users is compatibility. What other software will work with the program? What peripheral devices? And, is there any chance of transferring the data file to another computer?

Table 11 shows the compatibilities of each of the database systems. Compatibility with a wordprocessor means that the database file can be read and used by the wordprocessor. For instance, you might prepare form letters to "Dear (Field 1)". When the wordprocessor prints your letters it will read your database file, insert field 1 — hopefully someone's name — in the proper place and continue printing the letter. The body of the letter might contain other references to fields in the database file, such as amount of purchase, which would also be inserted. Once the first letter is printed, the wordprocessor will print another, this time using data from the second record in your database. Letters will continue to be printed until the last record is reached.

As supplied, none of the programs will work in double-density mode. Since your database is limited to the contents of one disk by all of the programs except *File-Fax*, a double density drive could effectively double the maximum file size possible. A CCA DMS user, however, has modified the note and point commands in that program to make it compatible with Percom double density drives. Those changes are apparently available through CE Software to owners who request them. The next upgrade of *File-Fax* will reportedly be compatible with Percom drives. The fact that a program is available for several computers does not mean that

data files will be compatible. It does, however, allow a user who switches to a different computer to work with a program which is familiar.

TABLE 11 — COMPATIBILITIES

Feature	CCA DMS	Data Perfect	File-Manager +	File-Fax
Can wordprocessor use database file?	No	Letter Perfect	[Text Wizard]	No
Compatible with Visicalc?	No [Yes one way]	No	[Yes]	[Yes]
Works with Bit 3 eighty column board?	No [Yes]	Yes	No	No
Will program work double density? (Yes)		No	No	[Yes]
Works with Axlon Ramdisk?	No	No	Yes	No
Works with Macrotronics printer cable?	Yes	No	No	No
Version of program for Apple II?	Yes	Yes	No	Yes
Version of program for IBM PC?	No	No	Yes	Yes
Version of program for CP/M?	Yes	No	No	No
Version of program for Commodore 64?	No	No	[Yes]	Yes
Version of program for Osborne?	No	No	No	Yes
Version of program for NEC PC 8001?	No	No	No	Yes
Version of program for Victor 9000?	No	No	No	Yes
Result of exiting program?	Returns to BASIC	Boots new disk	Must turn off ATARI	Must turn off ATARI

The next version of CCA DMS will allow the transfer of database files to *Visicalc*. (Transfer in the other direction will not yet be possible.) *FileManager+* will be compatible with the planned new version of *Text Wizard* (which probably will not be called *Text Wizard II*). Also, versions of *FileManager+* are planned for the Commodore 64 and the NEC 6000.

A new program from Synapse called *TrendManager* will be able to move data between the *FileManager+* and *Visicalc* formats. *TrendManager* is reportedly a statistical program (similar to *Visiplot/Visitrend*) which will allow six or more chart and graph formats. A planned *File-Fax* utility disk will allow files to be saved in formats compatible with *Visicalc* or Atari DOS. LJK's *Data Perfect* and *Letter Perfect* both use a non-standard DOS; however, a utility program (\$29.95) is available to convert files between Atari DOS and LJK DOS.

If I were to design a database system with the worst features of all four programs, it would have the short documentation of CCA DMS, have the limited report formatting capabilities of *FileManager+*, and use the large number of disks (two per database file) that *Data Perfect* requires. Like *File-Fax*, it would have extremely limited mathematical capabilities and would be incapable of creating subfiles or of adding fields to or deleting fields from existing databases. Also, it would have *FileManager+*'s inability to save report formats and CCA DMS's occasional problems with error handling.

If I could design the same system picking the best features described above, it would have CCA DMS's copyable disk so that users could list, study and

modify code to their hearts' content. The large maximum record length of *FileManager+* and maximum number of fields allowed by *Data Perfect* or *File-Fax* would surely be included. It would be able to sort on up to ten levels like CCA DMS, and would handle sorts to any depth like *File-Fax* and be compatible with the Bit 3 80-column board, as are *Data Perfect* and (soon) CCA DMS. *Data Perfect*'s global editing feature would be in there too. Last, files could be used by a wordprocessor (that's *Data Perfect* and, hopefully soon, *FileManager+*), and would be compatible with *Visicalc* (either one-way like CCA DMS or through another program like the ones planned for *File-Fax* and *FileManager+*). □

Another ATARI Word Puzzle by Marcy Caruthers
will appear in our next issue.

UTILITY

#

6:

24K disk

by Brian Moriarty

Does your ATARI 810 Disk Drive have trouble reading other peoples' disks? Do your own programs load perfectly one day and "disappear" the next? If so, you may be a victim of the 810 Speed Problem.

810 disk drives manufactured before 1982 have notoriously poor speed regulation. The speed control circuit uses cheap components which make it very sensitive to changes in supply current and temperature. This can cause the rotation speed of the drive to vary wildly from its nominal setting of 285-290 RPM.

The difficulty is aggravated by the fact that early 810s contain an inadequate data separator. A data separator "spreads apart" the data and timing pulses coming off the disk, thereby improving the drive's ability to read data recorded at different speeds. Virtually all drives in the 810's price range include a good data separator; yet ATARI did not begin incorporating a reliable separator into the 810 until early 1982.

Take heart, early 810 owners! There's an easy way to find out if your drive speed is out-of-spec. **A.N.A.L.O.G. Computing** proudly presents The Snail — a highly accurate disk-drive tachometer that will help you diagnose and eliminate problems caused by ATARI's thrifty manufacturing.

Words of warning.

You will void the warranty on your 810 Disk Drive if you open it up to adjust the speed. This includes both

the regular 90-day warranty and any extended service contracts you may have paid for. If the warranty has already expired, you can fool around with your disk drive all you want, secure in the knowledge that a service technician will get richer if you foul something up. **A.N.A.L.O.G. Computing** assumes no responsibility for damages resulting from the use of the Snail program.

Now that you've been properly warned, let's take a look at The Snail.

Suppose you want to find out how fast a wheel is turning. One way to do it would be to mark a spot on the rim of the wheel and count the number of seconds it takes for the spot to make one complete revolution. Dividing 60 seconds by this figure would give you the rotation speed of the wheel in revolutions per minute (RPM).

The Snail uses a similar technique to determine the speed of your 810. It tells the drive to read the first sector on a disk and records the access time in 60ths of a second (jiffies). Then it divides the access time into 3600 (the number of jiffies in a minute) to determine how fast the drive is spinning.

To assure accurate timings, The Snail averages the results of 32 consecutive readings before dividing. This "smooths out" the data enough to eliminate short-term speed variations that could produce misleading results.

No ATARI program is complete without a nifty graphics display. This program uses player/missile graphics to draw a multicolored "snail" on your TV screen. The snail crawls along a line of RPM figures and changes color if your drive speed is outside the recommended range. The cute little snail is certain to delight small children — and how many disk utilities can make that claim?

Running the program.

After you've typed in and D:CHECKed the Snail program, save it on a disk. Then find an old formatted disk you don't care about, insert it into the drive you are testing and type RUN. After about three seconds your TV screen should look like this:

X = ⊥

Figure 1.

S = ⊕

Answer the "Drive Number?" prompt by typing 1, 2, 3 or 4 (no RETURN is necessary). The selected drive should start spinning and you will hear the steady beep-beep-beep of sectors being read. If the drive isn't connected properly, or the disk isn't formatted, or you type an illegal drive number, you'll get an error message along with a rude bleat from the console.

Soon the Snail will slide across your TV screen, dragging a white line along with him. When he stops, the pointer at the end of the line will indicate the average speed of your disk drive in revolutions per minute.

The optimum speed of an ATARI 810 Disk Drive is 288 RPM. As long as your drive speed remains near this value (285-290), the Snail will glow a healthy green. Faster or slower speeds will cause the Snail to turn red with anger.

To check another drive, or to abort the program, press the START key. Avoid touching the BREAK or SYSTEM RESET keys — these can cause the drive the spin helplessly until you turn off its power switch.

Adjusting your drive speed.

If the Snail is staying consistently "in the red," it's time to open up your drive and adjust the speed. The

adjustment is an easy and relatively safe operation as long as you take your time. To do it, you'll need a penknife or safety razor, a medium-sized Phillips head screwdriver and a small flat screwdriver.

Clean your work area thoroughly to avoid contaminating the drive mechanism. Then locate the four circular screw-hole covers on top of the 810 and carefully pry them out with the knife or razor. Use the Phillips head screwdriver to remove the four long retaining screws that hold the top cover in place. Gently lift the cover off the base of the drive and set it aside. Don't lose the screws!

You should now be looking into the raw, steaming guts of your 810. Avoid touching any of the wires or components inside the drive. And don't drop any foreign objects into the mechanism.

Your next task is to locate the potentiometer (knob) that controls the rotation speed of the drive. If you own a very early version of the 810, the speed potentiometer will be located near the back left side of the drive. It's a knurled plastic wheel, white or light blue in color, with a flat slot on the top (see Figure 2).

Figure 2.

In later versions of the 810, the speed control looks like a little green or blue box with a tiny screw on the top. You'll find it just left of center, a few inches away from the back of the drive (Figure 3).

Figure 3.

Now you're ready to adjust the drive speed. Load the Snail program, insert a formatted disk into the opened drive and type RUN. Specify the proper drive number and wait for the snail to appear.

If your drive has a wheel-type speed control, carefully insert the end of your flat screwdriver into the slot on the wheel. Turn the wheel very slightly clockwise if the drive speed is too high (>290), or counterclockwise if the speed is too low (<285). Be patient; let the snail stabilize after each new adjustment. By carefully tweaking the wheel back and forth, you should be able to make the snail hover around the 288 mark. Replace the drive cover (did you lose the screws?) and the job is finished.

If your drive has a box-type control, insert the end of the screwdriver into the tiny screw on top of the box (you may need a very small screwdriver to do this). Turn the screw counterclockwise if the drive speed is too high, or clockwise if the speed is too low. This is a multi-turn potentiometer, so it may take several complete turns to make a significant difference. Let the drive stabilize after each adjustment, and keep tweaking the screw until the snail hovers comfortably close to 288 RPM. Replace the drive cover and congratulate yourself for your cleverness. □

Program Variables

X, Q, I

General-purpose working variables.

W

Horizontal direction of the snail.
1=RIGHT, -1=LEFT.

HNEW

The next horizontal position of the snail.

HOLD

The previous horizontal position.

PMPAGE

The first free memory page above the Snail program.
Used to initialize player/missile graphics.

PMBASE

Absolute address of the first free byte in PMPAGE.

ML\$

This string holds the 72-byte machine language routine contained in the DATA statements on lines 330-350. ML\$ does 90% of the work in the Snail program; it sets up the built-in hardware timer, reads the disk sectors, stores the timer readings and adds them together for averaging.

TEST\$

This 4-byte string holds a tiny machine language routine (PLA, JMP \$E453) that checks to make sure the disk drive is actually working before testing the speed.

DUMMY\$

A 128-byte dummy buffer for the resident disk

handler. The address of this buffer is passed to the handler so that it won't overwrite anything important when it reads the disk.

WORK\$

Used to store the 32 timer readings obtained by the machine language routine in ML\$.

PAYROLL SOFTWARE FOR THE ATARI® 800™

Miles Payroll System™ is an advanced and comprehensive payroll accounting system designed for businesses today. Cumulative totals are maintained for each employee, as well as complete reporting, check writing, and W-2 reporting. Some features include:

- Random access file organization for fast updating of individual records.
- Allows weekly, biweekly, semimonthly or monthly pay periods.
- Completely menu-driven and user-friendly.
- Regular, Overtime, Double time, Sick, Holiday, Vacation, Bonus and Commission earning categories.
- Payroll deductions include Federal W/H Tax, State W/H Tax, City W/H Tax, FICA, SDI, Group Insurance and 3 user-defined deductions.
- Tax sheltered annuity deduction capability for IRAs and other tax shelters.
- State and Federal Unemployment Insurance maintained.
- Complete file viewing and editing capability.
- Maintains up to 50 employees.
- Up to 10 user-defined Worker's Compensation classifications.
- Federal Tax tables may be changed in only 15 minutes each year by user when IRS changes tax.
- Table method used for State and City Tax, allowing compatibility with any state's or city's tax.
- Produces 15 different reports, including W-2 Forms Report.
- Checks calculated and printed automatically.
- PROGRAM ENABLING MODULE™ protects valuable payroll information from unauthorized users.
- 3 user-defined payroll deductions to accommodate customized needs such as savings, profit sharing, tax shelters, pensions, etc.
- Pay period, monthly, quarterly and yearly cumulative totals maintained for each employee.
- Automatic input error detection and recovery protects system from user-generated errors.
- Easy-to-follow, detailed, and comprehensive user's manual and tutorial leads the user step by step allowing anyone with little computer experience to easily operate the package. Includes index.
- Color, sound, and graphics utilized for user ease.
- Maintains employee pay history.
- Allows for manual payroll check writing.
- Packaged in a handsome 3-ring deluxe pocketed binder with 3 diskettes and manual.
- Reasonable price.

See your local store, or contact Miles Computing.

OUR GAME

by Joel Gluck

Psssst. Hey you. Yeah, you. C'mere. A little closer . . . I know you. You're the person who has always wanted to write a video game. You know some BASIC, and maybe you've even tried your hand at a game or two, but for some reason it never quite worked out.

Maybe you got bored with your idea. Maybe you were disappointed with the results you were getting. Maybe you didn't know enough BASIC or enough about your ATARI.

Well, let me tell you something. I know hundreds of people like you. Their hearts are in the right place, and most of them have some really good ideas. All they need is a little push . . .

The Idea

A while ago I was offered the opportunity to write a column for A.N.A.L.O.G. Never one to turn down a great chance, I said "sure."

The problem was that I needed an idea for the column. Managing Editor Jon Bell suggested a few things, and one of them really caught my fancy; a column for people who are interested in writing video games.

Given that starting point. I began to think about "the ultimate column." How about a column that didn't only talk about writing video games, but developed one over a series of articles? Why stop there? Why not let the readers participate? They could send in ideas about anything; the general plot of the game, graphic and sound effects, game options, what the game should be called, any aspect at all. It would be a total collaboration between myself and the readers.

That's the idea. That's why this column is called *Our Game*.

Good Games

What makes a good video game good? Well, there are many different kinds of video games, so to be more specific, we'll be talking more about arcade-style games, and not so much about adventures, or computer chess, or card games.

A video game, like any game, should be fun. How much fun, you say? Well, it should be more fun than just watching television. When you sit down at a TV set to relax, you have a choice you can either sit back and watch, or you can tune on your computer and play a game. A video game should be enjoyable enough to convince you to turn on the computer.

Another test of a good game is the "replayability factor." A game may be fun, but does it keep you up playing 'til the wee hours? Does it make you say: "Aw, just one more game . . .?"

A good video game should take "a minute to learn and a lifetime to master." It should have complexities, but not more than your average 10 year-old can handle — unless, of course, the game is meant for small children. It shouldn't be too difficult or too easy; it should allow the novice to play a satisfying game, yet keep the experienced player from feeling he's done it all.

Many decent arcade games are unsuccessful because a first-time player loses too quickly. A well-designed game leaves the player satisfied with his performance, so that he wants to play again.

I/O

Input/output usually refers to the flow of data into and out of a device or a program. In video games, it can describe how the player interacts with the game. The input is the means of playing the game: the joystick, paddle, keyboard, keypad, trackball, light-pen, or whatever. Output is the way the game talks back to the player, usually through graphics and sound effects (although I'm sure someone is working on video games that you can smell.)

Good input should be simple and feel natural. Would *Space Invaders* be as good if you had to type F-I-L-R-E on a keyboard, rather than pushing a button? A more realistic example is *Missile Command*: Doesn't the track-ball in the arcade version feel much more natural than the joystick in the home version?

Good output is not easy to achieve. Both graphics and sound must be appealing and dynamic. More significantly, they must be integrated. What good are a whole bunch of weird sound effects if an alien makes no noise when it blows up?

Another point about graphics: While great art isn't necessary, it is nice to have a variety of shapes and colors. The same applies to sound; I'm not demanding Mozart, but how about a little victory tune or some other music thrown in at appropriate times?

Output reaches its climax in "the special effect." Every good video game should have at least one

impressive special effect. In *Defender*, it's the huge explosion: in *Star Raiders*, it's "going into hyperspace." Although not strictly necessary, a good special effect can turn an "eh" game into a "wow" game.

All good home computer games should have a fairly elaborate introduction and conclusion, and good arcade games should have an eye-catching "attract mode" (what the machine does when nobody is playing it). Computer games should have plenty of options to keep players interested; the options should be simple to choose and convenient to enter.

A good video game should also be easy and fast to replay; you shouldn't have to sit through the instructions or list of options again. Neither should the game itself be too long. Take *Eastern Front*: It's a great game, but it takes hours to play, and you can't save the game and come back to it later. That's poor design.

The subject matter of a game is also important. A game may have all the attributes mentioned above, but if it's concerned with stamp collecting, I'd hardly be compelled to play. Furthermore, it's possible that a game can be too violent, or objectionable in other ways. A game based on destroying people in wheelchairs might not go over too well.

Separating the Pac-Men From the Boys

I can sum up the crucial element of a good video game in one word: originality. Any competent programmer can write yet another version of *Asteroids*, but the real genius is that of the original author.

Of course, I don't insist on *total* originality. *Galaxians* was based on *Space Invaders*, yet made a significant contribution of new ideas. *Galaga*, on the other hand...

This is not to say I refuse to play unoriginal games. I merely frown upon them. When I see another rehash of *Frogger*, for example, I say to myself "Boy, what a waste of creative energy!" Nothing sells as well, or is quite as impressive, as a new, original game.

Your Move

That about sums up what makes a good game. Do you disagree? I'm sure I missed *something*. Please write and tell me what you think.

Not only that, if you have any ideas for the game we're going to write together in the coming months, I'd like to hear them. Any important or trivial thing, whether it be an entire plot or simply a name (although it's a bit premature for that) will be warmly received.

Send your ideas, questions, and contradictions to:

Our Game
c/o A.N.A.L.O.G. Magazine
P.O. Box 23
Worcester, Mass. 01603

In most cases I won't be able to reply by mail, but I will try to include as much reader input as I can in future columns.

Next time we'll be discussing the steps for writing a video game, from the birth of the idea to the final touches. □

*In addition to slaving away full time as a student at MIT in Cambridge, Joel has written several programs for the ATARI Program Exchange including **Attank!**, **Babel**, and **fun-FORTH**.*

ATARI, 400 ARE TRADEMARKS OF ATARI, INC.

ATARI[®] MEANS BUSINESS

BUSINESS PACKAGES FOR \$195.00 EACH

For the first time, Financial Software Plus introduces business packages for the Atari 400 or 800 computer that simulates business packages found on much larger and expensive computer systems. All our packages are written by an accountant-programmer and program designer so that you can be assured that our packages will meet your individual requirements.

INVENTORY

- Capacity of 500 part numbers, 250 customers, 250 vendors per disk.
- Maintains customer files, vendor files, and sales history by month and year-to-year date.
- Generates purchase orders, invoices, quotations, regular mailing labels, and shipping labels.
- Reports Include: Quantity in stock, quantity on order, backorder, reorder, and sales activity.
- Ability to limit reports by part numbers and vendor or both.

PAYROLL

- Capacity of 100 Employees per disk.
- User changeable tax codes-five different tax tables may be set up.
- Miscellaneous earnings and deductions categories are user specified and changeable at any time.
- Prints checks, W2's, month-end, quarterly, annual and tax reports.
- Fixed or variable deduction capability

COMMON FEATURES

- Will run on a one or two disk drive system at any time.
- All data disks are created automatically-unlimited storage capacity.
- All reports can be printed to the screen or printer-printer is optional.
- Can act as a stand alone package or a fully integrated system with our general ledger package.

Stop on down to your nearest dealer and ask for a demonstration.

OMNIMON!
CDY Consulting
421 Hanbee
Richardson, Texas 75080
\$99.95

by **Brian Moriarty**

An advertising manager I know once joked that "today's product flaws are tomorrow's features." According to this definition, ATARI home computers are among the most feature-packed on the market. The 400/800 operating system in particular is full of quirky little "features" which 3rd-party suppliers have been successfully exploiting for years.

One of the most interesting flaws in the OS is the wasted 4K memory bank located at hex \$C000. OMNIMON!, a new hardware product from CDY Consulting, replaces this otherwise useless memory area with a powerful ROM-resident system monitor, similar to the one included as standard equipment on other popular micros such as the Apple II.

What it can do.

OMNIMON! is entered by pressing SYSTEM RESET while holding down either the OPTION or SELECT key. You can also activate it with a USR call out of BASIC, or by executing a JSR \$C001 instruction in machine language. Once "inside," you can examine, search, disassemble and alter memory locations, monitor the 6502 registers and hardware stack, read and write individual disk sectors and keep printed records of your work. Best of all, you can access these functions whenever the computer is turned on, regardless of what other software may be running (including a cartridge).

The screen photo shows the OMNIMON! title display and a menu of all available commands. The menu can be reviewed at any time by typing the "?" character, a thoughtful touch which typifies the friendliness of the system. All of the most-needed monitoring and debugging functions are available. Many are reminiscent of those included in the ATARI Assembler/Editor cartridge.

The disk I/O commands are the most interesting part of the OMNIMON! system. They allow you to read any specified range of disk sectors into RAM, using either the 128 byte/sector boot format or the 125-byte/sector DOS format — in either single or double density mode! This means you can load and execute binary DOS files without using a DOS. OMNIMON! also lets you convert DOS files to boot files and vice-versa, a capability found only in the most expensive software-based disk management programs. Other possibilities include dumping any block of RAM, OS or cartridge ROM out to a disk and moving it back into RAM anywhere you like.

OMNIMON! checks the syntax of all user inputs and reverts to reasonable defaults if no parameters are specified. All of the ATARI's built-in screen editing functions are supported; you can use the "T" (Toggle) command to enter data in either hexadecimal or ATASCII characters.

Installation

It took less than five minutes to get OMNIMON! up and running on the 800 system in my office. First you pop open the lid, pull out the personality board in Slot #1 and discard its plastic cover. Then you pull out one of the OS ROM chips and plug the L-shaped OMNIMON! board directly into the empty socket. Solder a single jumper into place, replace the OS chip and personality board and you're ready to go. OMNIMON'S 16 page user's guide includes complete installation instructions for both the ATARI 800 and 400 computers. It cannot be used with the 1200XL system.

Compatibility.

The OMNIMON! board has behaved itself fairly well in the several weeks since I installed it. It appears to be fully compatible with all of the ATARI programming environments I tested, including the BASIC and Assembler/Editor cartridges, Microsoft BASIC, the ATARI Macro Assembler, OSS BASIC A+ and MAC/65, the ABC BASIC compiler and valFORTH.

I did run into trouble with a couple of copy-protected game disks. For instance, my review copy of *Pinhead* by Utopia Software refuses to boot properly on my modified 800; instead of initializing the game, the system makes a gurgling noise and jumps into OMNIMON!. A similar thing happens when I try to use *Disked* by Amulet Enterprises. Every time I answer a sector number prompt, the system drops out of BASIC and into OMNIMON!.

It's hard to say whether this behavior is being caused by the OMNIMON! board or by the offending software itself. The rarity of the phenomenon suggests that the programs are making illegal entries into the ATARI's resident disk handler, thereby interfering with OMNIMON!'s hooks into the operating system. This is similar to the problem owners of the new Apple IIe system are having with disks that were copy-protected for the older Apple II and II+ systems. The moral in both cases is the same: Avoid non-standard OS calls!

OMNIMON! can be a great addition to your ATARI computer if you know what to do with it. The ability to "freeze" a running program on-the-fly and examine the hardware registers is invaluable for testing and debugging; the sector-level disk functions are alone worth the price of the board. If you do lots of machine-language programming and know which end of the soldering iron to hold, OMNIMON! might be one of the smartest hardware investments you can make. Look for it at your local CDY dealer. □

A WARNING TO 1200XL OWNERS

If you own an ATARI 1200XL and typed in *Adventure in the 5th Dimension* from our last issue, you were in for a rude shock. The 1200XL operating system contains an insidious little bug which crashes the adventure every time you try to RUN it.

Unlike the ATARI 400 and 800 systems, the 1200XL is very picky about PRINTing to an OPENed screen device, especially when you're in a "forced" split-screen mode. The entire screen goes wacky if your PRINT statement makes the cursor enter the bottom text window. Try it yourself!

```
10 GRAPHICS 0
11 REM * Open the screen device (5:)
12 OPEN #2,8,0,"5:"
13 REM * Invoke forced split-screen
14 POKE 703,4
15 REM * Cursor to bottom of window
16 POSITION 39,19
17 REM * Print to the window
18 PRINT #2;"COMPATIBILITY"
```

Fortunately, the adventure program violates this undocumented restriction only once, in line 12. Since the purpose of line 12 is purely cosmetic (it puts a fancy white border across the top of the response window), the simplest way to deal with it is to eliminate it altogether.

We apologize for not discovering this problem before *The 5th Dimension* went to press. Please let us know about any other compatibility problems you may discover in the 1200XL systems.

NEW THE MONKEY WRENCH II A PROGRAMMERS AID FOR ATARI 800 NEW AND IMPROVED — 18 COMMANDS

If you are a person who likes to monkey around with the ATARI 800, then THE MONKEY WRENCH II is for you!! Make your programming tasks easier, less time-consuming and more fun. Why spend extra hours working on a BASIC program when the MONKEY WRENCH can do it for you in seconds. It can also make backup copies of boot type cassette programs. Plugs into the right slot and works with ATARI BASIC cartridge.

The MONKEY WRENCH provides 18 direct mode commands. They are: AUTO LINE NUMBERING — Provides new line numbers when entering BASIC program lines. RENUMBER — Renumbers BASIC's line numbers including internal references. DELETE LINE NUMBERS — Removes a range BASIC line numbers.

VARIABLES — Display all BASIC variables and their current value. Scrolling — Use the START & SELECT keys to display BASIC lines automatically. Scroll up or down BASIC program. FIND STRING — Find every occurrence of a string. XCHANGE STRING — Find every occurrence of a string and replace it with another string. MOVE LINES — Move lines from one part of program to another part of program. COPY LINES — Copy lines from one part of program to another part of program. FORMATTED LIST — Print BASIC program in special line format and automatic page numbering. DISK DIRECTORY — Display Disk Directory. CHANGE MARGINS — Provides the capability to easily change the screen margins. MEMORY TEST — Provides the capability to test RAM memory. CURSOR EXCHANGE — Allows usage of the cursor keys without holding down the CTRL key. UPPER CASE LOCK — Keeps the computer in the upper case character set. HEX CONVERSION — Converts a hexadecimal number to a decimal number. DECIMAL CONVERSION — Converts a decimal number to a hexadecimal number. MONITOR — Enter the machine language monitor.

In addition to the BASIC commands, the Monkey Wrench also contains a machine language monitor with 16 commands used to interact with the powerful features of the 6502 microprocessor.

\$59.95

ATARI AND PET EPROM PROGRAMMER

Programs 2716 and 2532 EPROMs. Includes hardware and software. PET = \$75.00 — ATARI (includes sophisticated machine language monitor) = \$119.95

Eprom Cartridge- A.P.C. board and case which can be used in the ATARI 400 or 800 in the left or right slot. Uses 2532, 2732, or 2716 EPROMs. May contain up to 8K bytes. \$19.95

Memory Test- Make sure your RAM memory is normal. \$6.95 or \$9.95 on disk.

Typing Exercise- A typing drill program for beginners and experts. On disk \$12.95

More than just an Assembler/Editor! Now for the "64"

It's a Professionally Designed Software Development System

MAE
for
PET
APPLE
ATARI
~~\$169.95~~
New
Price
\$99.95

Blast off with the software used on the space shuttle project!

- Designed to improve Programmer Productivity.
- Similar syntax and commands — No need to relearn peculiar syntaxes and commands when you go from PET to APPLE to ATARI.
- Coreident Assembler/Editor — No need to load the Editor then the Assembler then the Editor, etc.
- Also includes Word Processor, Relocating Loader, and much more.
- Options: EPROM Programmer, unimplemented opcode circuitry.
- STILL NOT CONVINCED? Send for free spec sheet!

5 1/4 INCH SOFT SECTORED DISKETTES

Highest quality. We use them on our PETs, APPLES, ATARIs, and other computers. \$22.50/10 or \$44.50/20

EPROMs 2716 = \$4.50 2532 = \$7.50

Necromancer

The background of the entire page is a large, detailed illustration. It depicts a massive, pale blue face of a Necromancer with glowing red eyes, looming over a dark forest. In the foreground, a wizard with a long white beard and a green robe is casting a spell, with golden energy swirling around him. Several translucent, purple, humanoid figures are running through the forest. On the right, a large tree trunk has a face-like hollow in it, and a large, hairy spider-like creature is visible at the bottom right.

©1982 TIM BOXELL

First, restore the forests: Plant a glade of enchanted trees, and weave a network of ancient spells to protect them from hordes of attacking Troglydites.

Another spell rallies the forces of nature around you. The very trees become your armies, marching into combat in the cavernous lairs of the Necromancer.

Then, meet the EVIL ONE himself in a cataclysmic final conflict in a silent grave yard, among the dead.

The fastest action, the newest graphics and a little bit of old-time magic. NECROMANCER by Bill Williams, the latest Instant Hit from Synapse. If unavailable from your dealer, send \$34.95 plus \$2 shipping to us direct.

Available soon in 16K cartridge.

THE ATARI's FOUR COLOR CHARACTER SETS

16K cassette or 24K disk

by Dave Plotkin

The ATARI's ability to exploit redefined character sets is fairly well known to most users. Beginners may wonder why we bother with redefined character sets at all. After all, it's a lot of trouble (well, not really, but more trouble than PLOT and DRAWTO). You have to redefine each character either by hand (Heaven forbid!) or, more likely, using one of the many programs available for this purpose. Then you have to download the ROM character set into RAM, and modify the values of the bytes representing the letters which we want to change the shape of. While the step-by-step procedure for accomplishing this is amply documented elsewhere and is beyond the scope of this article, you can look at the program listing starting at line 32000 to see how it's done. The answer to why we bother is that the text modes are very powerful. Animation can be accomplished by simply printing characters to the screen. This is much faster than erasing and redrawing using PLOT and DRAWTO. It's also very easy to keep score right on the screen, since you are in a text mode. And, text modes take much less memory than the corresponding resolution graphic mode.

The limitation of using redefined character sets in GR.1 and 2 is that although five colors are available at once, each character can be only one color. You CAN get multi-color characters by artifacting a GR.0 character set. This is because each pixel in a GR.0 character is the same size as the pixels in GR. mode 8. A multitude of articles on artifacting GR.8 have appeared recently. Any of the methods of selectively placing pixels to obtain color that works in GR.8 will work when you redefine the GR.0 character set. You do lose half your horizontal resolution (plotting every other pixel), but more importantly, you lose your color indirection. Color indirection is the ability to change the value in a color register (using SETCOLOR) and have all the pixels

on the screen plotted in that COLOR change to the new color. The colors generated using a redefined GR.0 character set (and GR.8) depend primarily on the background color, not on the values in the color registers.

Obviously, then, what we'd like to have is a character set of fairly high resolution (say, equivalent to GR.7) in which each character could be multicolored and redefinable. Your ATARI contains just such a set — in fact, two such sets — but they are a little hidden and you have to know where to look and how to call them. The first clue to the existence of the "hidden" character sets comes from study of the instruction set for the graphics chip in your ATARI known as "Antic." This instruction set is a set of numbers which tell Antic how to display the screen — which lines on the screen are to be in which graphics mode. A series of numbers chosen from the instruction set define the whole screen. This series is known as the Display List. Each time you issue the GRAPHICS N command, BASIC constructs a Display List for you to define the screen. Again, the full treatment of Display Lists is well beyond the scope of this article. For example, if the Display List contains a 2, Antic will put a line of GR.0 on the screen. Similarly, a 6 will tell Antic to put a line of GR.1 on the screen. But what happened to 3, 4 and 5?? Aha!! Antic modes 3, 4 and 5, also known as the Antic Instruction Registers (IR) are the three "hidden" sets. They are, of course, not hidden at all, but you can't call them from BASIC with a GRAPHICS N command. You have to construct the display list yourself, which CAN be done from BASIC.

We are going to concentrate on IR modes 4 and 5. IR mode 3 is a twist on GR.0 with some changes to accomodate lower case descenders. But IR modes 4 and 5 are 4 color character sets. These sets can add quite a lot of pizzaz to your programs. IR mode 4

characters are the same size as GR.0 characters, while IR mode 5 characters are twice as tall. The similarity in size between IR mode 4 and GR.0 characters presents the powerful possibility of designing and debugging a game entirely in GR.0 and only converting over to IR mode 4 after it is running (that's how CAT and MOUSE was written). One more note before proceeding into how to put IR modes 4 and 5 on YOUR screen. The normal ROM character set in you ATARI is almost unreadable in these modes. So if you want to do any scoring on the screen you'll either have to redefine the numbers so that they are readable, or better, leave a portion of the screen in GR.0, 1 or 2 so that scoring and information is readable on these lines. In CAT and MOUSE I left the very last line on the screen as GR.0.

The first step to setting up IR modes 4 and 5 is to call:

10 GRAPHICS 0

Then you have to find out where the Display List is in memory. The ATARI maintains a pointer in memory at locations 560(low byte) and 561(high byte). The pointer tells you where the Display List is. So the next statement is:

```
20 DL=PEEK(560)+PEEK(561)*256
```

Finally, you have to poke the correct values into the Display List to generate the screen you want. For IR mode 4:

```
30 POKE DL+3,68:REM 68=64+IR MODE (4)
40 FOR A=6 TO 28:POKE DL+A,4:NEXT A
```

and for IR mode 5:

```
30 POKE DL+3,69
40 FOR A=6 TO 16:POKE DL+A,5:NEXT A
50 POKE DL+17,65:POKE DL+18,PEEK(560):
POKE DL+19,PEEK(561)
```

Line 50 is not necessary for the IR mode 4 Display List because the Display List for IR mode 4 is the same size (same number of lines on the screen) as the GR.0 Display List it replaces. The numbers POKED in line 50 finish every Display List by telling Antic where to go back to find the beginning of the list. Since IR mode 4 and GR.0 have the same number of lines, the numbers in line 50 already finish the IR mode 4 Display List, they were put there when you called GR.0. But IR mode 5 characters are twice as tall, so there are fewer lines on the screen, and thus a shorter Display List. You therefore have to finish the Display List by putting in the necessary last line that tells Antic "all done, start over." Recall that if you decide to customize your display further by putting some lines of normal text on the screen, you have to follow the rules about total number of scan lines

adding up to 192 (see *COMPUTE's First Book of ATARI*, "Designing your own ATARI Graphics Modes," by A.N.A.L.O.G. technical advisor Craig Patchett). Lines of GR.0 or 1 on an IR mode 4 screen are no problem, as they are the same height as IR mode 4. The same thing is true for lines of GR.2 on an IR mode 5 screen.

To specify the color of each pixel in the IR mode 4 and 5 characters is simple, although getting pleasing shapes and colors takes some experimentation. As you may already know, each letter is normally 8 columns (or pixels) wide. IR modes 4 and 5 break up the 8 columns of pixels into 4 columns of 2 pixels each. This reduces the horizontal resolution from the equivalent of GR.8 to the equivalent of GR.7. The color of each GR.7-sized block is determined by the way in which the 2 pixels in each group are lit. When neither pixel is lit, you get background color, register 4 (SETCOLOR 4). When only the right pixel is on, you get the color in register 0 (SETCOLOR 0). When only the left pixel is on, you get the color in register 1 (SETCOLOR 1). And when both the left and right pixels are on, you get the color in register 2 for regular letters and the color in register 3 for inverse letters. IR modes support inverse. The sketch below shows the enlarged layout of possible pixel patterns and the generated color. Note that the way the colors are defined is identical to how GR.7 defines its colors. Note also that IR mode 5 has the same horizontal and vertical resolution as GR.7, but IR mode 4 has the horizontal resolution of GR.7 and the vertical resolution of GR.8. You may wonder — is there a graphics mode with this same resolution? Yes there is, but you have to adjust a GR.8 Display List to get it...

No Pixels Lit: Background color
 Right Pixel Lit: Color 1 (setcolor 0)
 Left Pixel Lit: Color 2 (setcolor 1)
 Both Pixels Lit: Color 3 or 4 (inverse)
 Mixed: Left half color 2, right half color 1

As you can probably imagine, a fair amount of trial and error is necessary to get just the right shapes and color combinations, so plotting by hand and trying out the results in a program is pretty forbidding. Let me suggest therefore, that you pick up a copy of Sheldon Leemon's "INSTEDIT," one of the finest and most versatile character editors I've ever run across. It's available from the ATARI Program Exchange.

The game CAT and MOUSE is included to show you the versatility of IR modes 4 and 5. Note that there are no Player/Missile Graphics, no fancy screen PEEKs and POKEs, not even any machine

ATARI 800

DISKEY

by Sparky Starks

Potential into practical reality. This is the core of DISKEY — a remarkable utility program that gives ATARI disk drive owners the flexibility to accomplish tasks that other utilities either ignored or only hinted at. With DISKEY, the user will be able to actually examine a disk and its directory, and repair some files that might otherwise have been lost. DISKEY also performs a multitude of other practical functions, including the following:

- ★ Automatically lists any unreadable or destroyed sectors
- ★ Sends contents of disk to printer selectively
- ★ Up to four separate drives may be addressed
- ★ Can be used to backup some of those "un-backupable" disks
- ★ Allows direct examination of any file
- ★ Over 50 separate key functions available

As an ATARI 400 or 800 owner, you have extraordinary power and versatility at your disposal. Tap into those resources effectively with DISKEY — new from Adventure International.

ATARI 400/800 32K DISK

052-0158 \$49.95

(Note: Some features will require 40K)

SOME OF DISKEY KEY FUNCTIONS

- A Clear screen and filename
- B Byte compare, D1 to D2, OS to DS
- C Copy sectors, OD to DD, OS to DS
- D Toggle destination drive
- E Erase disk (format)
- F Select file sub-menu
- L Set automatic function lower limit (OS)
- M Modify Sector Map
- N New destination sector
- O Toggle originate drive
- P Print screen to printer
- Q Query (search for hex key, drive OD, sector OS to DS)
- R Read new OS, set DS to match
- S Search for ASCII key, drive OD, sector OS to DS
- T Tape to disk
- U Upper case conversion of printer lower case
- V Toggle write verify
- W Write memory buffer to sector DS, drive DD
- X Select EOR Sector Map screen print mask
- Z Zero memory buffer
- + Read upward, next sector on disk
- Read downward
- ? Directory information
 - ! Select directory sub-menu
- cB Byte compare, D1 to D2, whole disk
- cC Copy D1 to D2, whole disk
- cD Decimal to hex, ASCII conversion
- cE Erase disk (without new format)
- cF Modify sector forward sector chain reference
- cH Hex to decimal, ASCII conversion
- cL Locate bad sector on drive OD
- cN Modify sector file number reference
- cO Select one-drive functions sub-program
- cP Print current Disk Map
- cR RPM test drive OD
- cS Special file copy, no directory reference from source
- cV VTOC update and repair, drive OD
- cY Toggle Sure Response prompt enable
- FA File binary load address headers to printer
- FD Delete file
- FF Select filename for all file functions
- FL Lock file
- FM Show memory address load position in file
- FQ Relative Query
- FR Rename file
- FS Relative Search

BASIC ROUTINES FOR THE ATARI

by
Jerry
White

Finally, a self-help system that cuts through the stuffy technical jargon and allows the user to learn effective programming techniques fast! BASIC ROUTINES FOR THE ATARI has been written especially for ATARI 400 or 800 users who wish to write programs in BASIC. This package comes complete with an extensive manual and your choice of a tape or disk which contains all of the routines from the manual — which means you'll be able to actually see each of them in action on your ATARI. Some of the BASIC routines include joystick, sound, player missile strings and much more — and presented in a way that you'll quickly be able to learn and apply to your own programs.

If your programming ability lies somewhere between beginning and advanced, then look no further — BASIC ROUTINES FOR THE ATARI is the system for you.

BASIC ROUTINES book with 16K TAPE

language (except to download the character set, and I didn't write that, Alan Zett did). The game runs fairly quickly. I did make some concessions to BASIC's lack of speed, however. The sound is very simple, the strategy of the cats extremely single-minded, and the score is updated infrequently. Once you get the strategy, however, I think you'll find it fun to play. Couple of hints to get you started — the cats won't follow you past the edge of the screen, and if you keep a wall between your mouse and the cats, they just won't know what to do!

CAT AND MOUSE is a maze game. You control the mouse with your joystick. The object is to go around the maze, eating bits of cheese. You are diligently chased by three cats who will tenaciously follow you wherever you go. The mouse and cats travel at the same speed, so don't make any mistakes! At four points around the maze are large cheeses that allow your mouse to eat the cats for a while, getting extra points. When you eat the big cheese, the cats change color. A short warning tone tells you when the cats are about to change back to normal. Each new cat emerges from the center of the maze. They will not emerge when you are at the center, so don't worry. One of the nice features of the graphics is the moving walls of the maze. By merely exchanging the contents of two color registers, the walls appear to move. This same effect rotates the cat colors, changes the eyes of the scared cats from white to red and back again, animates the bits of cheese, and flashes the score on the bottom of the screen. Isn't color indirection wonderful?

DOCUMENTATION:

GAME VARIABLES —

TEMP — holds color register 0 (708)

Z1, Z — LOCATE variables

X,Y-coordinates of the mouse

ST — value of the joystick

XS,YS — offset of mouse

XN,YN — new coordinates of mouse

T — number of dots eaten

P,R,L — loop variables

SC — score

A(L) — status of cat; 0 then cat on board

AX(L), AY(L) — coordinates of cats

TEMPX, TEMPY — temporary coordinates of cat

DIRX, DIRY — direction cat is to move

FL(L), Z1(L) — keeps track of what is under the cats (like a cheese)

Q — counts down time till cats change back

CR — number of mice left

LINE DOCUMENTATION —

100 Rotates the screen colors

110 Check to see if mouse eats cats

120 Reads joystick

130 — 200 Move mouse, test for cheese eaten, keep

score, test for eating the big cheese.

210 — 350 Logic for moving cats

500 — 560 Routine for mouse getting eaten

600 — 640 Routine for mouse eating the cats

700 — 720 Change the cats

900 — 930 End of game routine

1000 — 1040 Initializing routine to modify the display list.

1100 — 1350 Draw the board

32000 — 32111 Redefine the character set

```

HAVE YOU FLOWN YOUR ATARI TODAY?

FINAL FLIGHT!

Imagine yourself at the controls of a small, single-engine plane, 10,000 feet in the air, on your approach to the runway and safety. You're running low on fuel, but your instruments show that you're on the glide path, and lined up with the runway. It's a beautiful, sunny day, and you can see the airport in the distance, across the grassy fields. But the crosswind is tricky, and it will take all your skill to land safely. You're coming down now, and the runway is getting closer. A bit left, OK, now lower the power, fine, now put down the flaps. Pull the nose up a bit more, you're a little low. Watch the power! Don't stall. OK. Here comes the runway. You hear the squeal of tires on

pavement, your pulse quickens, you're down, but watch it, you're pulling right! Brakes, brakes! Left more! You've stopped safely! Good job. The first real-time flight simulator for ATARI is now available from MMG Micro Software. Written entirely in machine language, there are four levels of difficulty, landings in clear or foggy weather, landings with or without instruments, and with or without the real-time view from the cockpit. **Final Flight!** requires Atari 400/800, 24K, 1 joy stick, and is offered on tape or disk for the same suggested retail price of \$29.95.

MMG

Final Flight!

is available at your local dealer or direct from **MMG Micro Software**. Just send check or money order to P.O. Box 131, Marlboro, N.J. 07746 or for Mastercard, Visa, and C.O.D. deliveries call **(201)431-3472**. Please add \$3.00 for postage and handling. New Jersey residents add

6% sales tax.

Before I start, I would like to thank all the readers who wrote letters to **A.N.A.L.O.G.** about my last assembly-language game, **Fill 'Er Up!** Your kind remarks certainly made all the hard work worthwhile. It is also gratifying to see all the reader-submitted modifications to the program. This is why **A.N.A.L.O.G.** contains assembly-language source code listings whenever possible — to challenge readers to go beyond what they read, and in the process, learn more about their computers.

This brings me to an important point: Even though **A.N.A.L.O.G.** prints commented assembly source code, space does not permit a complete discussion of a program's inner workings. In order to do this, a documentation package similar to APX's **Source Code for Eastern Front (1941)** would be needed. In such a package, the program author would provide in-depth documentation, memory maps, and so on.

If enough interest is shown, **A.N.A.L.O.G.** will publish a detailed documentation package for selected feature programs. If you would be interested in seeing such packages, just drop a postcard in the mail to me here at **A.N.A.L.O.G.** I welcome any comments or suggestions, such as the inclusion of the source files on a diskette, etc. There's no obligation, of course — we'd just like to hear your opinions.

So much for introductions. Let's get on to this issue's public-domain game program, **Livewire!**

Typing the program.

Before you go hacking away at your keyboard, let's take a quick look at the listings accompanying this article.

LISTING 1 is the main data and data checking routine. This listing is used to create both the disk and cassette versions of **Livewire!**. As with **Fill 'Er Up!**, the data statements are listed in hexadecimal (base 16) to allow it to run in a 16K cassette system. It's a necessary evil.

LISTING 2 should be added to LISTING 1 if you are using a 410 cassette recorder.

LISTING 3 should be added to LISTING 1 if you are using a disk drive.

LISTING 4 is the assembly-language source code for **Livewire!**, created with the ATARI Macro Assembler. **You DO NOT have to type in LISTING 4 to play the game!** It is provided for those readers interested in seeing how the program works.

Follow the instructions below to make either a cassette or disk version of **Livewire!**.

Cassette Instructions

1. Type LISTING 1 into your computer. If you have C:CHECK (Issue 11), use it to verify your typing. This will save headaches later.

2. After LISTING 1 has been correctly typed into your computer, type in LISTING 2. The program

lines will automatically merge with LISTING 1. Make sure these lines were typed correctly. It's a good idea to CSAVE the entire program at this point.

3. Type RUN and press RETURN. The program will begin checking the DATA lines, printing the line number as it checks each one. It will alert you if it finds any problems. Fix incorrect lines and re-RUN the program if necessary until all errors are eliminated.

4. When all the data lines are correct, the program will ask you to "READY TAPE AND PRESS RETURN." Place a blank tape in your recorder, press RECORD and PLAY simultaneously and press RETURN. The message "WRITING FILE" will appear and the program will create a boot tape version of **Livewire!**, printing each data line number as it goes. When the READY prompt reappears, you're ready to load the game. Make sure your BASIC program has been CSAVEd before continuing.

6. To play **Livewire!**, rewind the tape created by the BASIC program to the beginning. Turn your computer OFF and remove any cartridges. Press PLAY on your recorder, then turn your computer ON while holding down the START key. The computer will BEEP once. Press RETURN and **Livewire!** will load and run automatically.

Disk Instructions

1. Type LISTING 1 into your computer. If you have D:CHECK II (Issue 10), use it to verify your typing.

2. After LISTING 1 is correctly typed into your computer, type in LISTING 3. The lines will automatically merge with LISTING 1. It's a good idea to SAVE the entire BASIC program after you're done typing.

3. Type RUN and press RETURN. The program will begin verifying the DATA lines, printing the line number as it checks each one. It will alert you if it finds any problems. Fix incorrect lines and re-RUN the program if necessary until all errors are eliminated.

4. When all the data lines are correct, the program will ask you to "INSERT DISK WITH DOS, PRESS RETURN." Place a disk with DOS in drive 1 and press RETURN. The message "WRITING FILE" will appear and the program will create an AUTORUN.SYS file, printing each data line number as it goes. When the READY prompt reappears, you're ready to play the game. Make sure your BASIC program has been SAVED before continuing.

6. To play **Livewire!**, place the disk containing the AUTORUN.SYS file into drive 1. Turn the computer OFF, remove any cartridges and turn the computer back ON. **Livewire!** will load and run automatically.

Playing the game.

It's not every day that you get a chance to venture inside your computer. Prepare yourself, because **Livewire!** pits you against the horrible dangers that lurk inside that seemingly peaceful plastic enclosure.

In **Livewire!**, you are a logic probe on a mission to rid your computer of harmful electronic faults. You sit atop various circuit junctions (which just happen to spell "LIVEWIRE") as the enemies of your computer climb up the circuit lines toward you. There are 64 levels in the game, each one more difficult than the last.

You can use either a joystick or paddle to play **Livewire!**, but a paddle is recommended. Choose the desired controller with the SELECT key, then press START to begin playing.

Use your controller to move along the rim of the circuit. Your controller button fires up to six deadly electron bursts at a time, which destroy the enemy electronic faults on contact. Keep alert, because the enemies can also fire electron bursts at YOU!

In a tight situation, the space bar will destroy all enemy objects on the circuit. Use this weapon wisely, as you are allowed only one use of the space bar "zap" per circuit grid.

Points are awarded for the destruction of each enemy object. The current score is shown at the lower left of the screen. You begin each game with 3 lives (shown to the right of the score), with bonus lives awarded every 20,000 points. The current level number is shown at the lower right of the screen.

The ESC key will pause the game at any time. Press the ESC key a second time to continue game play.

Know your enemy.

The enemies in **Livewire!** are not aliens, monsters or any other tangible threat. They are electronic impulses, out to systematically destroy your computer.

ARCS are clever objects which unpredictably jump from one circuit line to another. They are worth 50 points each.

SURGES rise up the circuit grid toward you, then change direction, heading back toward the bottom. If they are not destroyed before they hit the bottom, they create another ARC. SURGES are worth 100 points.

TRANSIENTS are nasty objects which appear and disappear at random as they rise up the circuit. When they are invisible, they cannot be destroyed by your electron bursts, but they can still destroy you! Be particularly careful if the transients become invisible near the top of the circuit. TRANSIENTS are worth 150 points.

VOLTAGE SPIKES aren't particularly dangerous until they reach the top of the circuit. When they do, they turn into SHORTS, described below. If you destroy a VOLTAGE SPIKE before it reaches the top of the circuit, it is worth 200 points.

RESISTANCES are perhaps the most dangerous enemy of all. They CANNOT BE DESTROYED by electron bursts. In fact, any shots which hit them are immediately bounced back at the logic probe! The only way to destroy a RESISTANCE is to use the space bar "zap" feature. When destroyed, a RESISTANCE is worth 250 points.

SHORTS are started by VOLTAGE SPIKES when they reach the rim of the circuit. Up to 4 of these enemies may be present at one time. Shorts are different from other objects in that they follow the rim of the circuit at random. They will destroy you on contact, so be very cautious when they are present. SHORTS can only be destroyed by the space bar "zap" feature, and are worth 400 points.

Final Comments

Livewire! is a difficult game, but it can be mastered. Cautious players will last longer than "daredevils," as is true with most games on the market today. I invite any comments, suggestions or modifications readers care to send in, and will be happy to print useful modifications in future issues. □

SLO-SEC

(SLOw speed SECTOR write kit)

CREATE YOUR OWN PROTECTED DISKS WITH YOUR ATARI DISK DRIVE

- * SLO-SEC enables your ATARI 810 disk drive to write unreadable (bad) sectors used in bad-sector disk protection routines.
- * Easy disk drive modification requires only two solder connections.
- * SLO-SEC will not interfere with normal disk drive operation.

Complete SLO-SEC kit:
Hardware and Step-by-Step Instructions: \$9.95

Note: SLO-SEC is designed for second generation drives (manufactured after December, 1981)

For fast service use certified check, money order or charge card. Please allow 2 to 3 weeks for personal checks to clear.

Please send _____ SLO-SEC kits at \$ 9.95 each.

BASIC

BASM

ASSEMBLY

THE BASIC COMPILER THAT'S MORE THAN JUST A COMPILER!

- Are you fed up with slow interpretive BASIC?
- Are you fed up with having to kludge binary into your program?
- Are you fed up with being unfamiliar with assembly?
- **BASM combines the speed and flexibility of assembly with the familiarity of BASIC!**
- **No more awkward binary segments:** BASM handles both BASIC and assembly!
- **Learn assembly language by example:** BASM can list the assembly generated by your BASIC statements!

Atari and Commodore 64

AS EASY AS FALLING OFF... THE ALOG PAGEWRITER

For the Atari 400/800 (32K)

The **ALOG PAGEWRITER** turns your **ATARI** computer and 80 column printer into a very easy to use electronic typewriter. Because the entire page layout is displayed while the user is typing and editing, the **ALOG PAGEWRITER** is ideal for simple word processing tasks such as letters, notes, memos, or the kid's book reports and term papers. The average learning time is about five minutes.

KEY FEATURES:

- Uses standard Atari editing keys (e.g. INSERT, DELETE, TAB, etc.)
- A HELP screen with command summary
- Visible and fully adjustable margins
- FILL command for right justification
- Automatic return option (with word moving)
- Line 'Split' and 'Splice' commands
- Store 10 pages with no disk swapping
- Not copy protected

REQUIRED EQUIPMENT:

- ATARI 400 or 800 Computer
- ATARI 850 Interface Box
- At least 32K of RAM
- One disk drive
- 80 column printer

A FAST, SIMPLE, EASY TO USE

Word Processing Program
ONLY \$39.95

THE ALOG PAGEWRITER STORY

ALOG Computing was formed in July of 1982 by a group of professional scientific computer programmers who felt it might be fun, interesting and possibly profitable to apply advanced programming techniques to the creation of simple, useful and inexpensive software for personal computers.

The **ALOG PAGEWRITER** is the first of a number of products under development to meet our criteria for release. It is creative, simple, useful and inexpensive. But above all, it's fun. It was fun to develop and it's fun to use. We did it for the **ATARI** because we wanted to show that the excellent **ATARI** graphics can be used for more than games.

Join the gang of happy **PAGEWRITER** users and you'll see what we mean. We've had nothing but good reports so far.

We are the only software and computer company you will ever need!

by **Tony Messina**

Several weeks ago I (along with many other ATARI user group members) received a notice about a new word processor which was being offered by ALOG COMPUTING (no connection whatsoever with A.N.A.L.O.G.). The brochure stated the package was easy to use and could be learned within five minutes. I immediately called the publishers for an advanced copy for review and the package arrived within two days. Here are my findings.

The Design

Let me first tell you what the ALOG PAGEWRITER is not. It is **not** a full blown word processor with every conceivable function known to man. The design of the program was never intended to be such and the advertisement states this. With that out of the way, I can say that the ALOG PAGEWRITER is designed for simple word processing tasks such as composing letters, small reports and even small articles for publication (such as this review). As the name implies, the word processor creates documents a page at a time. Simply load the program and start typing. When one page is finished, save it to the disk and continue with the next page. When this is finished save it to the disk, and so on.

Commands/Features

The most unique feature of the ALOG PAGEWRITER is the display of the entire page layout. As you type in the text window, a bit mapped representation of the text appears in the upper graphics window. This lets you see exactly how the page will look when it is printed. In addition there are many commands available to adjust the margins of the page and format the output. All commands are of the form (CTRL) (Letter) If you can't remember which command to use, then CTRL H will produce a help screen which displays all commands and their function. This is a very nice feature to have. Typing in the text requires only familiarity with the standard ATARI editing functions. There are, however, commands which allow you to move the cursor to the top of a page, the beginning or end of a line, set double or single space mode between lines, justify lines, split lines for insertion of text, splice lines to get rid of unwanted spaces and a command to center text on a line.

Layout

When entering the PAGEWRITER from the initial screen, you are presented with a text mode at the bottom of the screen and a graphics mode at the top of the screen. The text window only displays one line at a time. You cannot view an entire document. This keeps things simple and isolates each line. The graphics window displays a simulated sheet of paper (orange outline) with left and right margins (green lines). As you type text, orange dots appear on the page to show the relative word position. As each page is completed it is saved to disk. The maximum number of pages per disk is limited to 10.

The Verdict

The ALOG PAGEWRITER does exactly what it claims to do. It is a well designed, user-oriented software product which is useful for simple word processing tasks. It does require you to read the documentation to become familiar with the commands but one reading will get you started. You may need to refer back to the documentation when implementing a little-used command. The PAGEWRITER supports a wide variety of 80-column printers and requires 32K and a disk drive. The price is \$39.95 but group orders of 5 units or more will cost you \$25.00. If all you plan to do are simple tasks then the ALOG PAGEWRITER is a bargain worth considering. □

BANK STREET WRITER
Broderbund Software
1938 Fourth St.
San Rafael, CA 94901
48K Disk \$69.95

by **Arthur Leyenberger**

Broderbund Software has recently released a new word processor for the ATARI computer called **Bank Street Writer**. It is billed as "The Home Word Processor" and will probably address the needs of a specific group of ATARI computer owners: The Home User.

At first glance, **Bank Street Writer (BSW)** looks like a powerful and easy to use piece of software. Let's look at what features a "home user" would require in a word processor and use these as criteria to evaluate **BSW**. In this way, you will be able to judge **BSW** for yourself.

A major use of a "home" word processor is to write letters. **BSW** allows top, bottom, left and right margins to be specified either just prior to printing or permanently with its utility program. Automatic paragraph indenting is accomplished by simultaneously pressing the CONTROL key and the letter "I". Page ejects may be viewed before printing and adjusted as necessary. Most of the features that a home user would require to write letters are available.

Some of the desirable letter-writing features not supported are: underlined text, right justification and block right capability. These absent capabilities do not prevent **BSW** from being useful for writing letters.

The second major use of a home word processor is to prepare reports and term papers by students. In addition to the features needed to write letters, the following capabilities are required: the ability to center text for making titles; page numbering and page headers (a one-liner that appears at the top of every page of the document except the first page); and finally, editing the text once it is written should be easy to perform and the program should prevent the user from making errors. **BSW** has all of these capabilities.

One of the strongest features of **BSW** is its ease of editing. For example, if the user wants to erase a block of text, the ERASE option of the main menu is selected. Then the cursor is sequentially positioned at the beginning and at the end of the block of text to be erased. Next, the computer highlights (with inverse video) the text in question and prompts, "Are

you sure you want to erase the highlighted text?" If the user answers yes the text is removed. Any other response is taken as a "No". Should the user suddenly realize that he did **not** want to erase the block of text after the text was removed, all is not lost. The UNERASE option of the main menu is selected and the missing text is restored.

The MOVE and MOVEBACK commands allow the user to shift blocks of text (up to 15 lines at a time) back and forth as a unit within the document. The same highlighting and query messages that appear with ERASE and UNERASE are used. Both the UNERASE and MOVEBACK commands only work on the last block of text accessed. Previously moved or erased text cannot be recovered.

Some additional features that are useful for writing reports are, regrettably, absent. Footnoting is not possible since superscripts are not supported. There is no method for passing printer control codes to the printer from either within the body of the text or elsewhere. This means that alternate type fonts such as bold face, italics or condensed printing can not be selected (assuming your printer has these capabilities). The only printer codes that are user selectable are the line feed/carriage return and form feed codes.

There is one feature of **Bank Street Writer** that makes it unique among the currently available word processors for the ATARI computer. This is the tutorial program that comes on the flip side of the disk. Unlike the word processor program itself which is written in **BASIC A+** (by Optimized Systems Software), the tutorial requires the ATARI BASIC cartridge to be installed. The tutorial covers the main functions of **BSW**. The first section explains text entry, capital letters, the return key and the wrap around feature. Wraparound allows the user to continue typing past the end of the 38 character line while the computer moves the excess words forward to the next line. Used instead of the carriage return on a typewriter, the wraparound function is a standard feature on almost all word processors.

The final portion of the tutorial program deals with the MOVE, MOVEBACK, ERASE and UN-ERASE functions. The tutorial is interactive in that it not only describes how a function works, but also requires the user to try it for themselves. In this way, the user gets hands-on experience using the program. Unfortunately the tutorial does not demonstrate the transfer functions (loading, saving, and printing documents). These are covered only in the manual.

Bank Street Writer uses a 38 character by 18 line screen. The maximum document size is approximately 2300 words (with the BASIC cartridge removed) which translates into roughly a nine page document. Since the program is written in BASIC it is not particularly fast. This is no problem when the document length is less than 3 pages. However, as the size of the document grows, the time it takes to switch from the "write" mode to the "edit" mode increases.

I began writing this review using **Bank Street Writer** itself. After about five 18-line screens (about half of this review) it was taking from 4 to 7 seconds to

scroll up one line! At one point I measured 17 seconds to go from the "write" mode to the main menu. It was at this point that I pulled the plug and switched to **Letter Perfect** (LJK Enterprises) to complete the review. My main complaint with this lengthy response time lies with its effect on the first time computer user. If a child's first exposure to using a computer for serious activities (like word processing) results in the perception that a program that is easy to use must also require a lengthy response time, then that child is being done a disservice.

In spite of its shortcomings, **BSW** is the easiest word processor program to use for the ATARI computer. It is inexpensive, there is good error protection, the manual is clearly written and well organized, and two copies of the program are provided. The current version is incompatible with the ATARI 1200XL computer.

Bank Street Writer has almost everything going for it — it is up to the user to decide if it goes far enough. □

DISK WIZARD

© 1982

A COMPLETE DISK UTILITY PACKAGE AT AN AFFORDABLE PRICE

THIS COMPREHENSIVE PACKAGE INCLUDES THE FOLLOWING POWERFUL PROGRAMS FOR THE ATARI® 800 COMPUTER (MINIMUM: 32 K)

DISK BACK-UP

- SINGLE / DOUBLE DENSITY
- SUPPORTS 1 OR 2 DRIVES
- ALLOWS BACK-UP OF DISKS PROTECTED BY BAD SECTORING
- FAST COPY OPTION
- SECTOR STATUS SUMMARY
- OPTIONAL PRINTOUT OF SECTOR STATUS

DISK EDIT

- REVIEW / MODIFY ANY SECTOR
- WORKS WITH ALL FORMATS
- SINGLE / DOUBLE DENSITY
- SECTOR DISPLAY IN HEX AND ASCII
- SCAN SECTORS FOR A SERIES OF BYTES OR A STRING
- DECIMAL / HEX NUMBER CONVERSION

DISASSEMBLER

- DISASSEMBLE FROM DISK BY FILE NAME OR SECTOR NUMBERS
- OPTIONAL OFFSET
- OUTPUT TO SCREEN OR PRINTER
- SINGLE / DOUBLE DENSITY

DISK SPEED

- VERIFIES / ALLOWS ADJUSTMENT OF DISK SPEED

COMPREHENSIVE MANUAL INCLUDED

FINE SCROLLING ON THE 1200XL

Here's an interesting trick for owners of the ATARI 1200XL — automatic fine screen scrolling in graphics mode 0!

This type of scrolling adds an interesting touch to text-oriented programs, eliminating the normal "jumping" nature of screen scrolling.

The program listed below is a short demonstration of the fine-scrolling ability of the 1200XL. Type it in and RUN it.

```
10 POKE 622,255
20 GRAPHICS 0
30 ? "FINE SCROLLING"
40 GOTO 30
```

You will notice that the program prints a message in an infinite loop. When the message fills the screen, the fine-scrolling mechanism starts.

To use this technique in your own programs, all you need are two commands: POKE 622,255 and GRAPHICS 0.

The POKE command to location 622 tells the system to use fine scrolling. By POKEing a zero here the scrolling can be turned off again if you like. The GRAPHICS 0 command is necessary to start the scrolling handler.

That's all that is needed! You can even use these two commands from BASIC's immediate mode if you like.

Hello, We're

Adventure International

And we're publishers of some of the finest microcomputer software programs available. If you can write a **top-quality** program, or can convert some of our best-sellers to other computers, we want to hear from you — Now.

We have the advertising, international distribution, manufacturing and marketing know-how to send top-quality programs to the top of the charts.

If your program is **top quality** — give us a call, or write for our Adventure International Author Information Kit.

We are publishers of the top-selling Scott Adams Adventure Series and other fine Entertainment and Applications Programs.

YOU'VE GOT FROM NOW 'TIL THE END OF THIS PAGE TO BECOME MOUNTAIN KING.

GO!

See all those
glittering diamonds?
Grab 'em.

You need 1,000 diamonds fast.

To score, you have to
burrow deep. Deep
into the caverns.

You craftily cop a dozen
jewels. Then, jump to the ledge
below. Then down to another. And
another. But, STOP!

There's nothing but an abyss
below. Nothing for you there except
a bad fall—and even worse, delay!

No, don't
go there.
You've already
stripped that
vein of diamonds.
Go where no one
has ever dared
venture before.

Follow the caverns.
Deeper and deeper.

Down the ladders. Over to
the right—more jewels...and
CURSES!...you've fallen.
And you're losing time.

Grab those diamonds.
Ah ha! You've reached 1000!
The Flame Spirit has been set free.
Now you must capture it.

Quick—down another ladder.
Listen!

Ghostly music
floating
through the
black tunnels.
That means
the Flame Spirit
is hiding nearby.

The music grows louder as you
draw closer.

Now softer (quick, go back the
other way). Louder again. Shine your

flashlight.
The Flame Spirit
is very near.
A flicker. Out of
the corner of your eye.
Shine that light!

There
it is. Now,
kneel
before the
Spirit and
grab it.
Gotcha! Run!
Run to the
Temple. Watch out! Behind you!
A vampire bat trying to
steal the Flame Spirit. Climb down,
below the ledge. Another bat!

Down. To the very bottom of the
mountain.
To the pit. And the darkness.
Lit only by the shimmer of
diamonds. Suddenly there's a rush of
movement...a giant spider—after you.

Run. Jump. Up to the ledge. Hurry!
Jump again!

Aarrrrggggghhhh! You're caught.

Woven in a tangled web. Hurry,
break loose before he returns and
you're devoured.

Ah! You've freed yourself. You've
lost time, but you've gained character.

Now, on to the Temple.
But beware of the guardian flames—one
false move and you'll end up charred
...and out of the game! Get to the
Temple Portal, the Spirit in your
grasp. Shine your light on the giant
guardian skull. You kneel. (Not out of
respect, but out of need—for without

kneeling,
entering the
Temple is forbidden.)

The entrance yawns
open. And you leap in. There,
enshrined deep within the

sacred Temple,
emblazoned
with gold, is the
sovereign
crown. You must
get that crown.
Without it, you
cannot become

Mountain King. With it, you'll rule.

But now comes the tough part.
Can you make the treacherous climb
back to the surface? Can you
avoid the relentless bats and
spreading cave fires on the
way? Can you even find the way?

Get Mountain King™ Plug it
into your home computer. It will
plunge you into the depths, and lift
you to the heights.

ANOTHER GAME TO DIG INTO.

It's Boulders and Bombs™
One to four can play. And with
99 levels of terrific tunneling
adventure, it's every bit as involving
as Mountain King.

Your challenge is to tunnel to
safety beneath the surface of an
unknown planet as hostile, alien
vultures seek to turn you into a
buried fossil, entombed in an alien
life form.

While day turns to night above
ground, you use your trusty roto-
auger to claw a path to safety
below ground—through tons
of earth, boulders, and the
ever-spreading green
cave fungus.

Fortunately,
you can unearth
time bombs along
the way to blast away
the hazards the vultures
toss at you.

But the crawling fungus
spreads as time runs out.

Now that you know the names of
these challenging new games, and
you know what it's like to play them,
there's one other thing you should
know:

They're from CBS Software. And
even though that name says a lot
about quality entertainment,
we haven't mentioned it until now.

Because
at CBS Software,
we believe our
computer programs should
speak for themselves.

ABSOLUTELY RELENTLESS

The challenge of inner space — the fury of an enemy that seemingly will not die.

This is SEA DRAGON — a battle to the death under the high seas! Slide into the Captain's chair, take the controls and prepare yourself for the most incredible non-stop action this side of Davy Jones' locker. SEA DRAGON puts you in control of a nuclear sub that's armed from stem to stern with enough firepower to take on King Neptune himself — and you'll need every missile, every torpedo, and every scrap of skill you can muster to survive.

The object of SEA DRAGON is to successfully navigate your sub through an underwater course past mountains and through labyrinthine passageways while avoiding clusters of explosive mines that rise from the seabottom. But the danger doesn't stop there — overhead, surface destroyers lace the water with depth charges; below, deadly attack bases and arcing lasers cut a killing swath that could reduce your sub to bubbling slag. But even these potentially lethal perils are dwarfed by the awesome menace that awaits you at the course's end.

SEA DRAGON — every possible "extra" is here to ensure your playing pleasure: exciting sounds, high score save, machine language graphics and an eye-popping scrolling seascape that extends the equivalent of over two dozen screens placed end-to-end, providing a diverse and unique challenge that will not diminish after repeated playings.

Nothing you've ever seen on your micro could possibly prepare you for this! You are ready now, ready for the ultimate in undersea action with a pace that is absolutely unyielding. SEA DRAGON — the arcade has finally come home.

FOR THE **APPLE** by John Anderson

FOR THE **ATARI** by Russ Wetmore

THE ORIGINAL ATARI® ONLY MAGAZINE

ANALOG COMPUTING

A.N.A.L.O.G. Computing is the original, most sought-after ATARI specialty magazine on the market. Each issue features program listings of utilities and games in both BASIC and Assembly language, tutorial articles, hardware and software reviews and updates on new products for both the ATARI home computers and the ATARI home game system. The articles in **A.N.A.L.O.G.** are written in a friendly, accessible style for both the novice and the advanced ATARI computer programmer. If you want the best, most extensive support for your ATARI computer system, then subscribe today. 1 year (6 issues) \$14, 2 years (12 issues) \$27, 3 years (18 issues) \$38. Cassette and disk subscriptions are also available. Cassettes and disks contain **all** programs listed in the magazine. Cassette (6 issues) \$36, disk (6 issues) \$60.

NEW

PREPPIE!

"LOOK MUFFY,
A COMPUTER GAME
FOR US!"

PREPPIE II IS HERE!

That's right you LaCoste-clad Atari owner. Wadsworth Overcash, our Weejuned young prepster continues his exploits — this time at college and just like daddy, he's decided to pledge a fraternity. Have we got surprises for him (and you)!

**AVAILABLE NOW
AT FINE COMPUTER
STORES EVERYWHERE**

by **Russ
Wetmore**

Good Golly! What A GAME!

The original arcade game **PREPPIE!** will give you hours of toe-tickling fun. **You** take the controls, moving your young prepster about on the golf course. And what a golf course! It's unlike any you have ever played on before. There are dangers **everywhere**, and only you can keep the little Ivy Leaguer from a fate worse than Penn State!

PREPPIE! is written in state-of-the-art machine language, is joystick compatible and fully utilizes the Atari's sound and graphics capabilities. Quite frankly, it will give you the most fun you can have on an Atari microcomputer.

PREPPIE! is available at fine computer, book, and hobby stores everywhere.

An exclusive game from

To order, see your local dealer. If he does not have the program you want, then call 1-800-327-7172 (orders only) or write for our free catalog.
